

# Self-Organization and Optimization for Graphics and Animation

Craig Reynolds

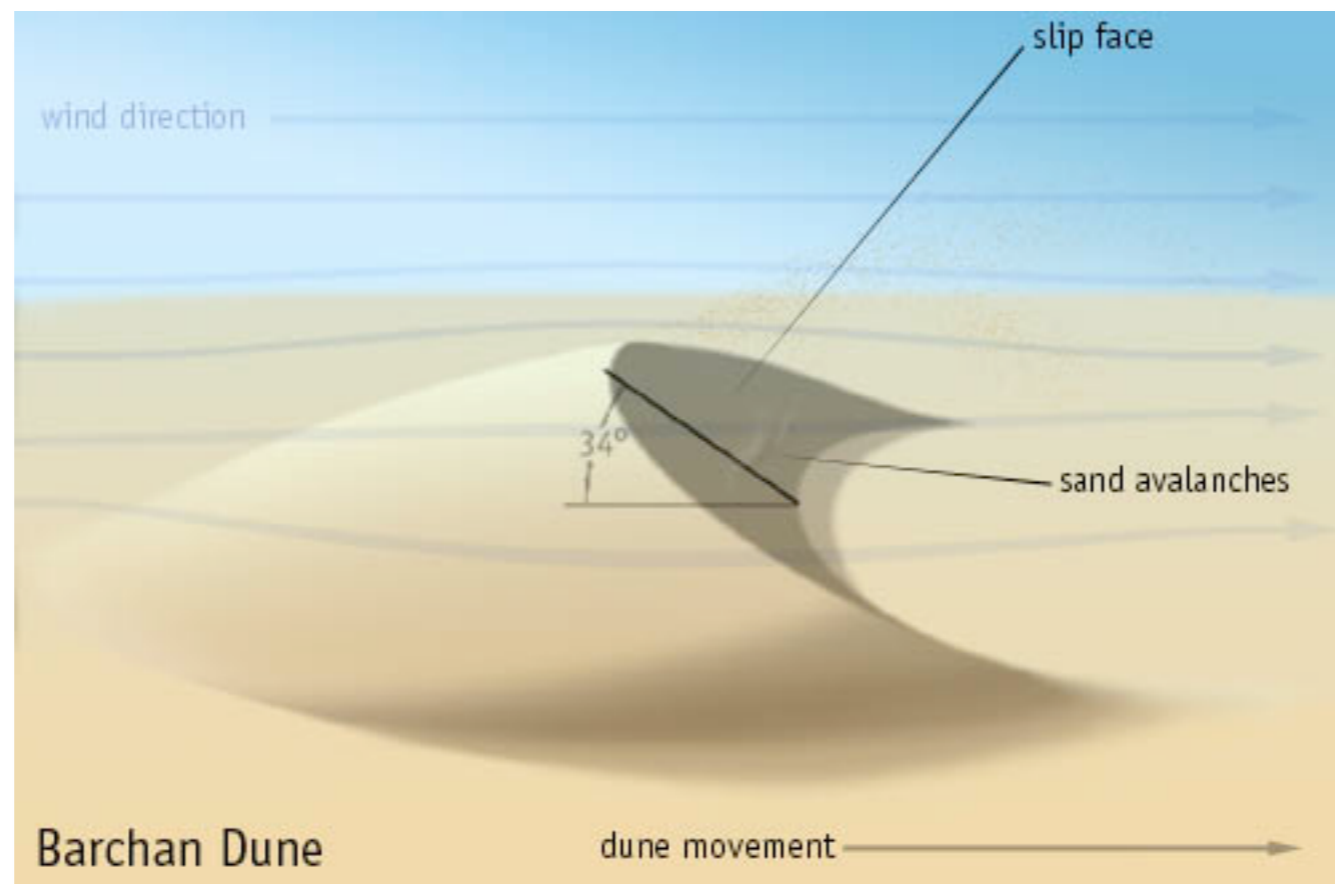

presented at:  
EPGY 2013 - Artificial Intelligence  
July 31, 2013

# In this talk

- Self-organization
    - flocking boids
    - steering behaviors
  - Optimization
    - steering behaviors
    - texture synthesis
-

# Self-organization

- many autonomous *agents* (“multi-agent simulation”)
  - local interaction between neighboring agents
  - emergence of global behavior or structure
-

self-organized criticality  
inorganic granular system

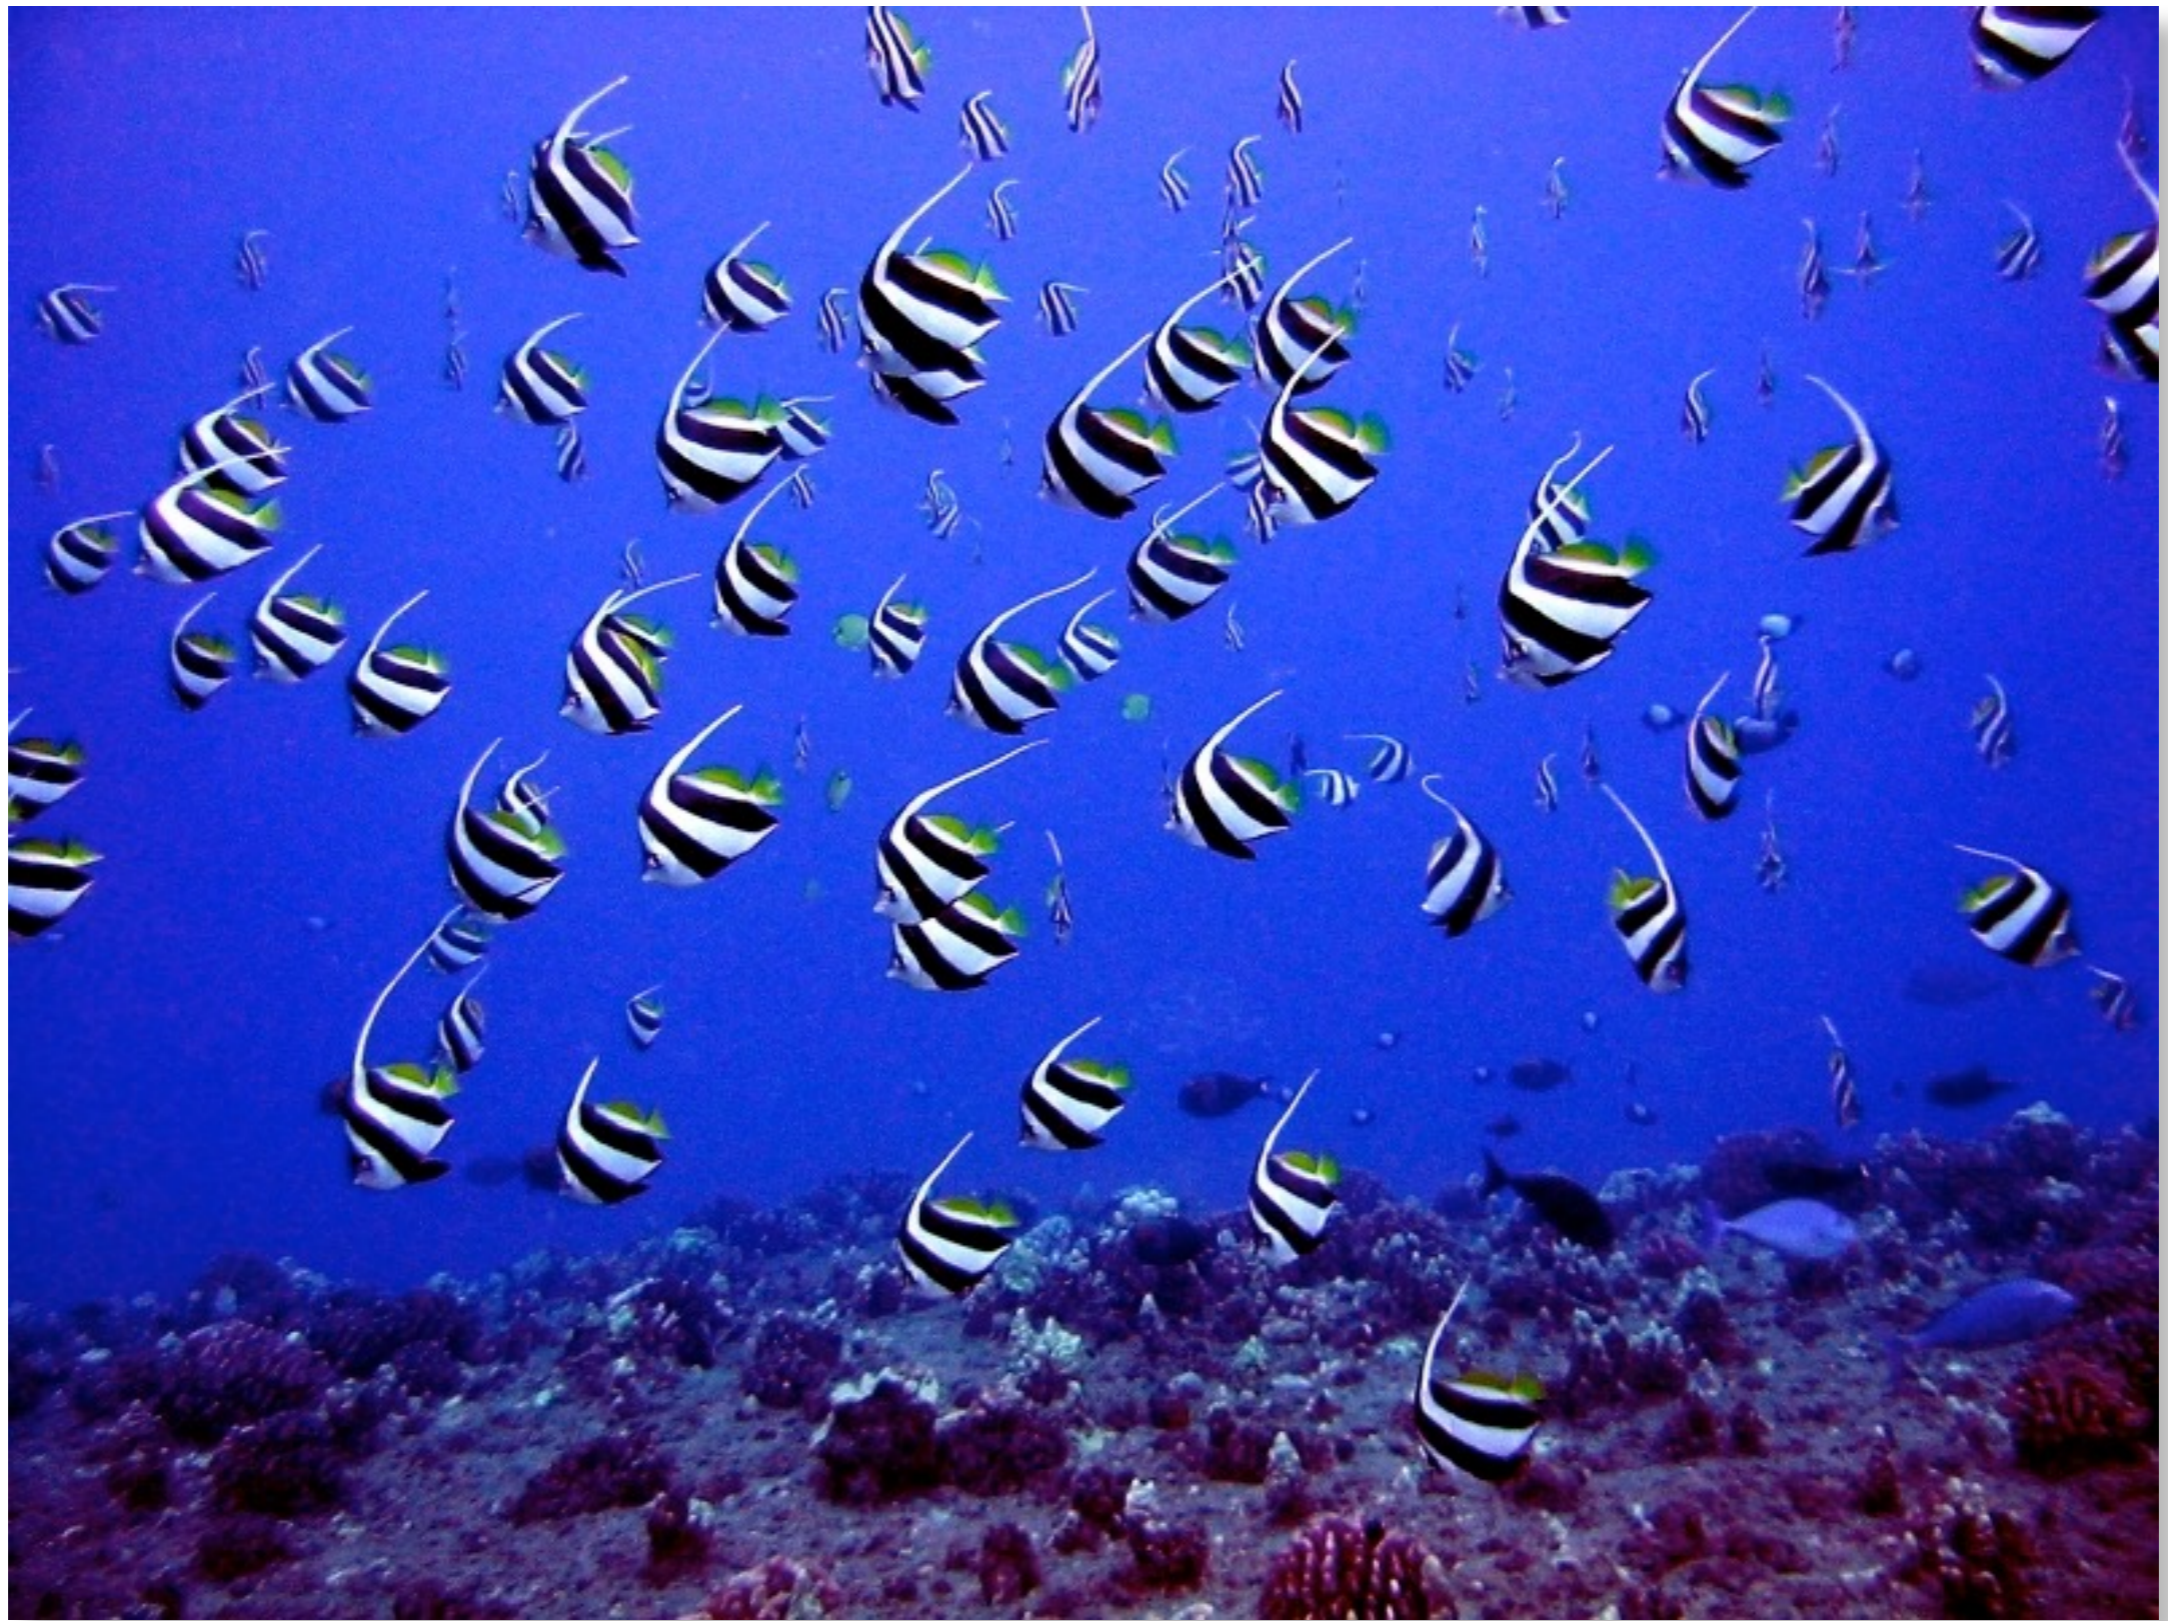

boids

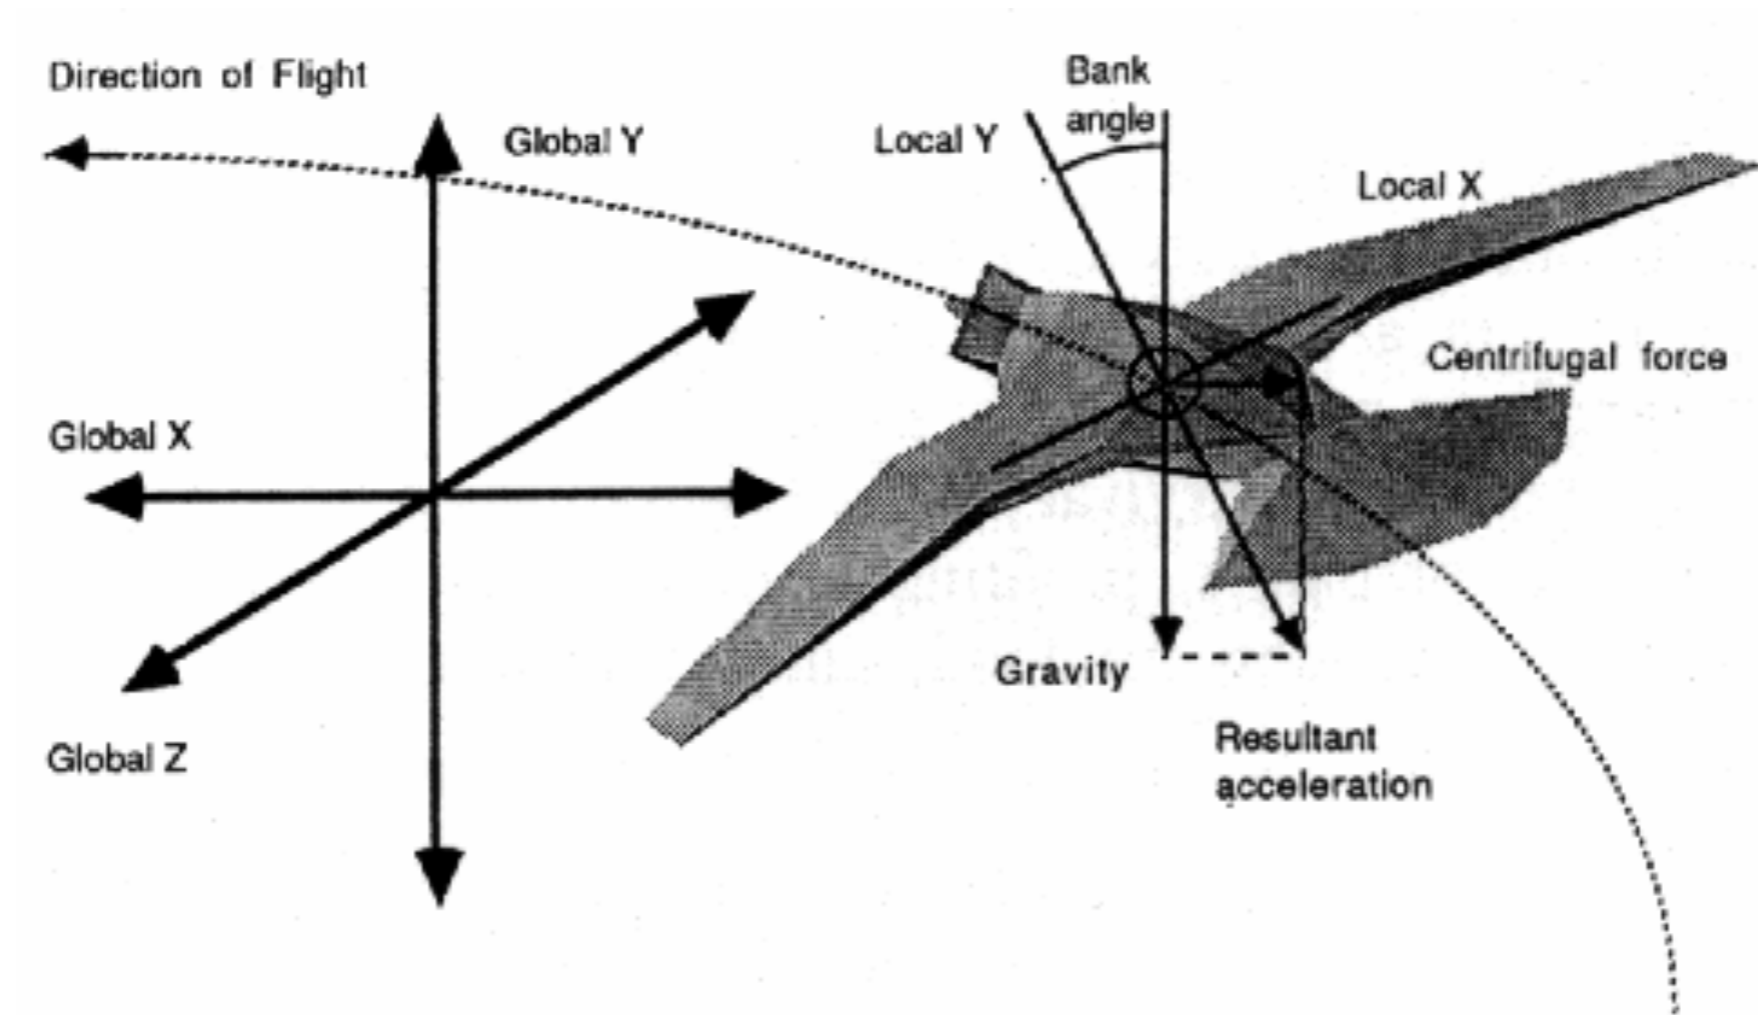

---

bird's local coordinate system and *banking*

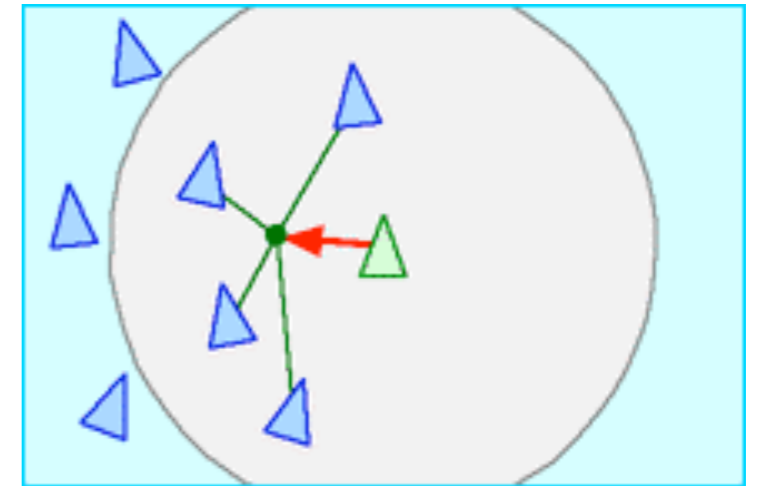

## Three component steering behaviors of flocking:

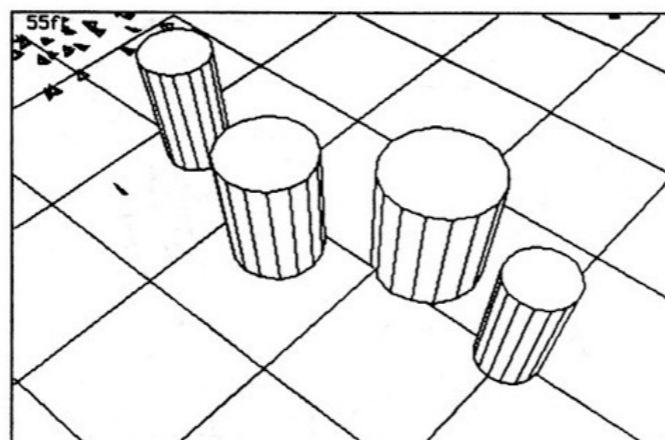

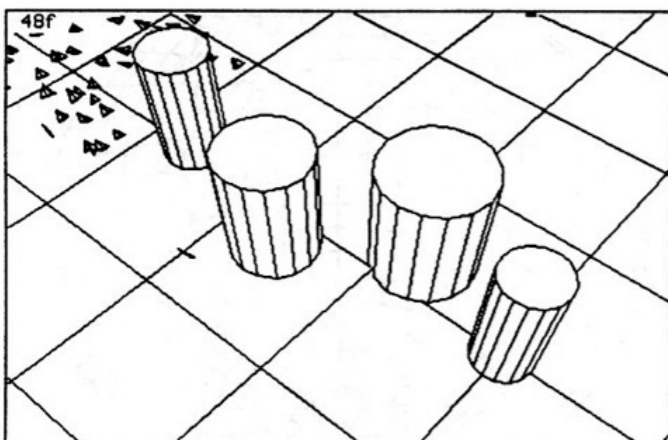

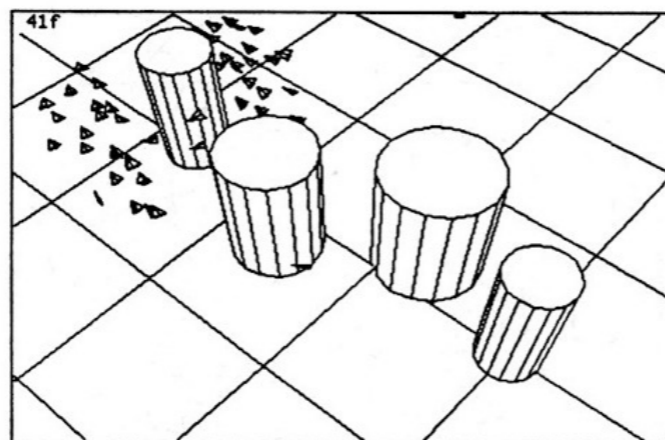

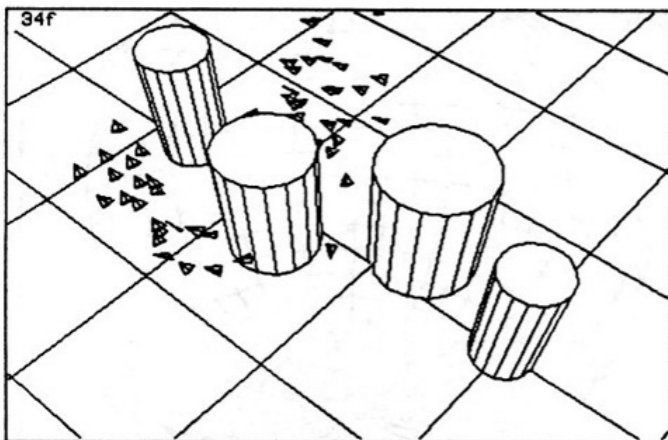

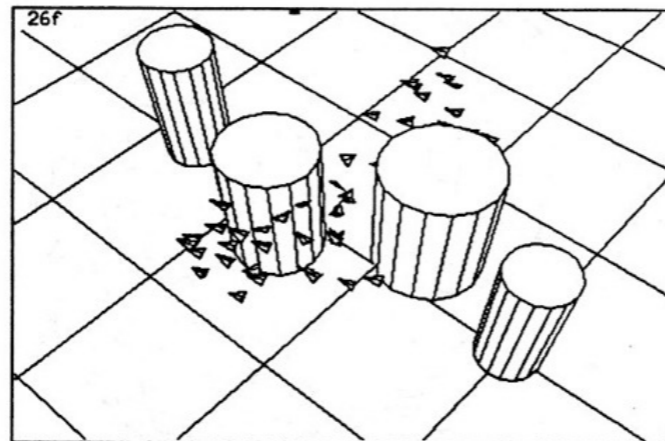

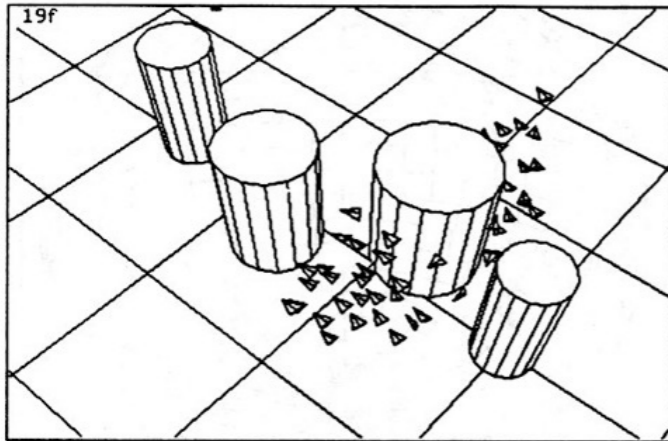

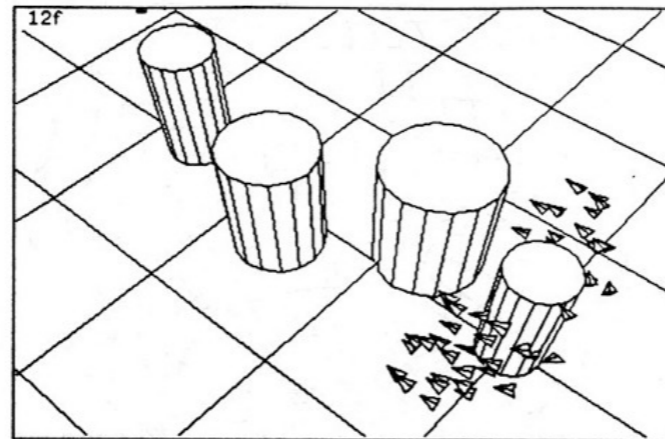

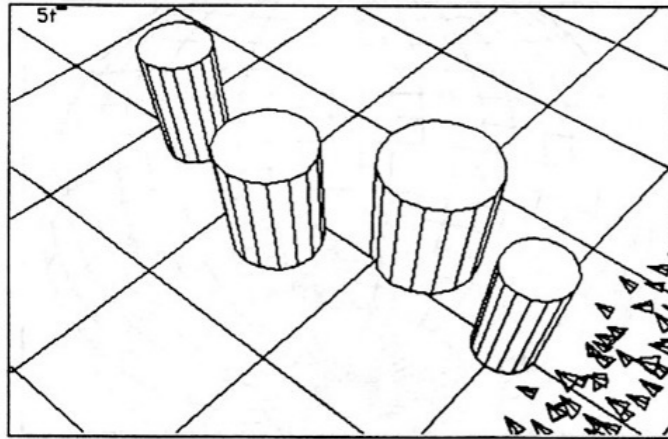

Separation

Alignment

Cohesion

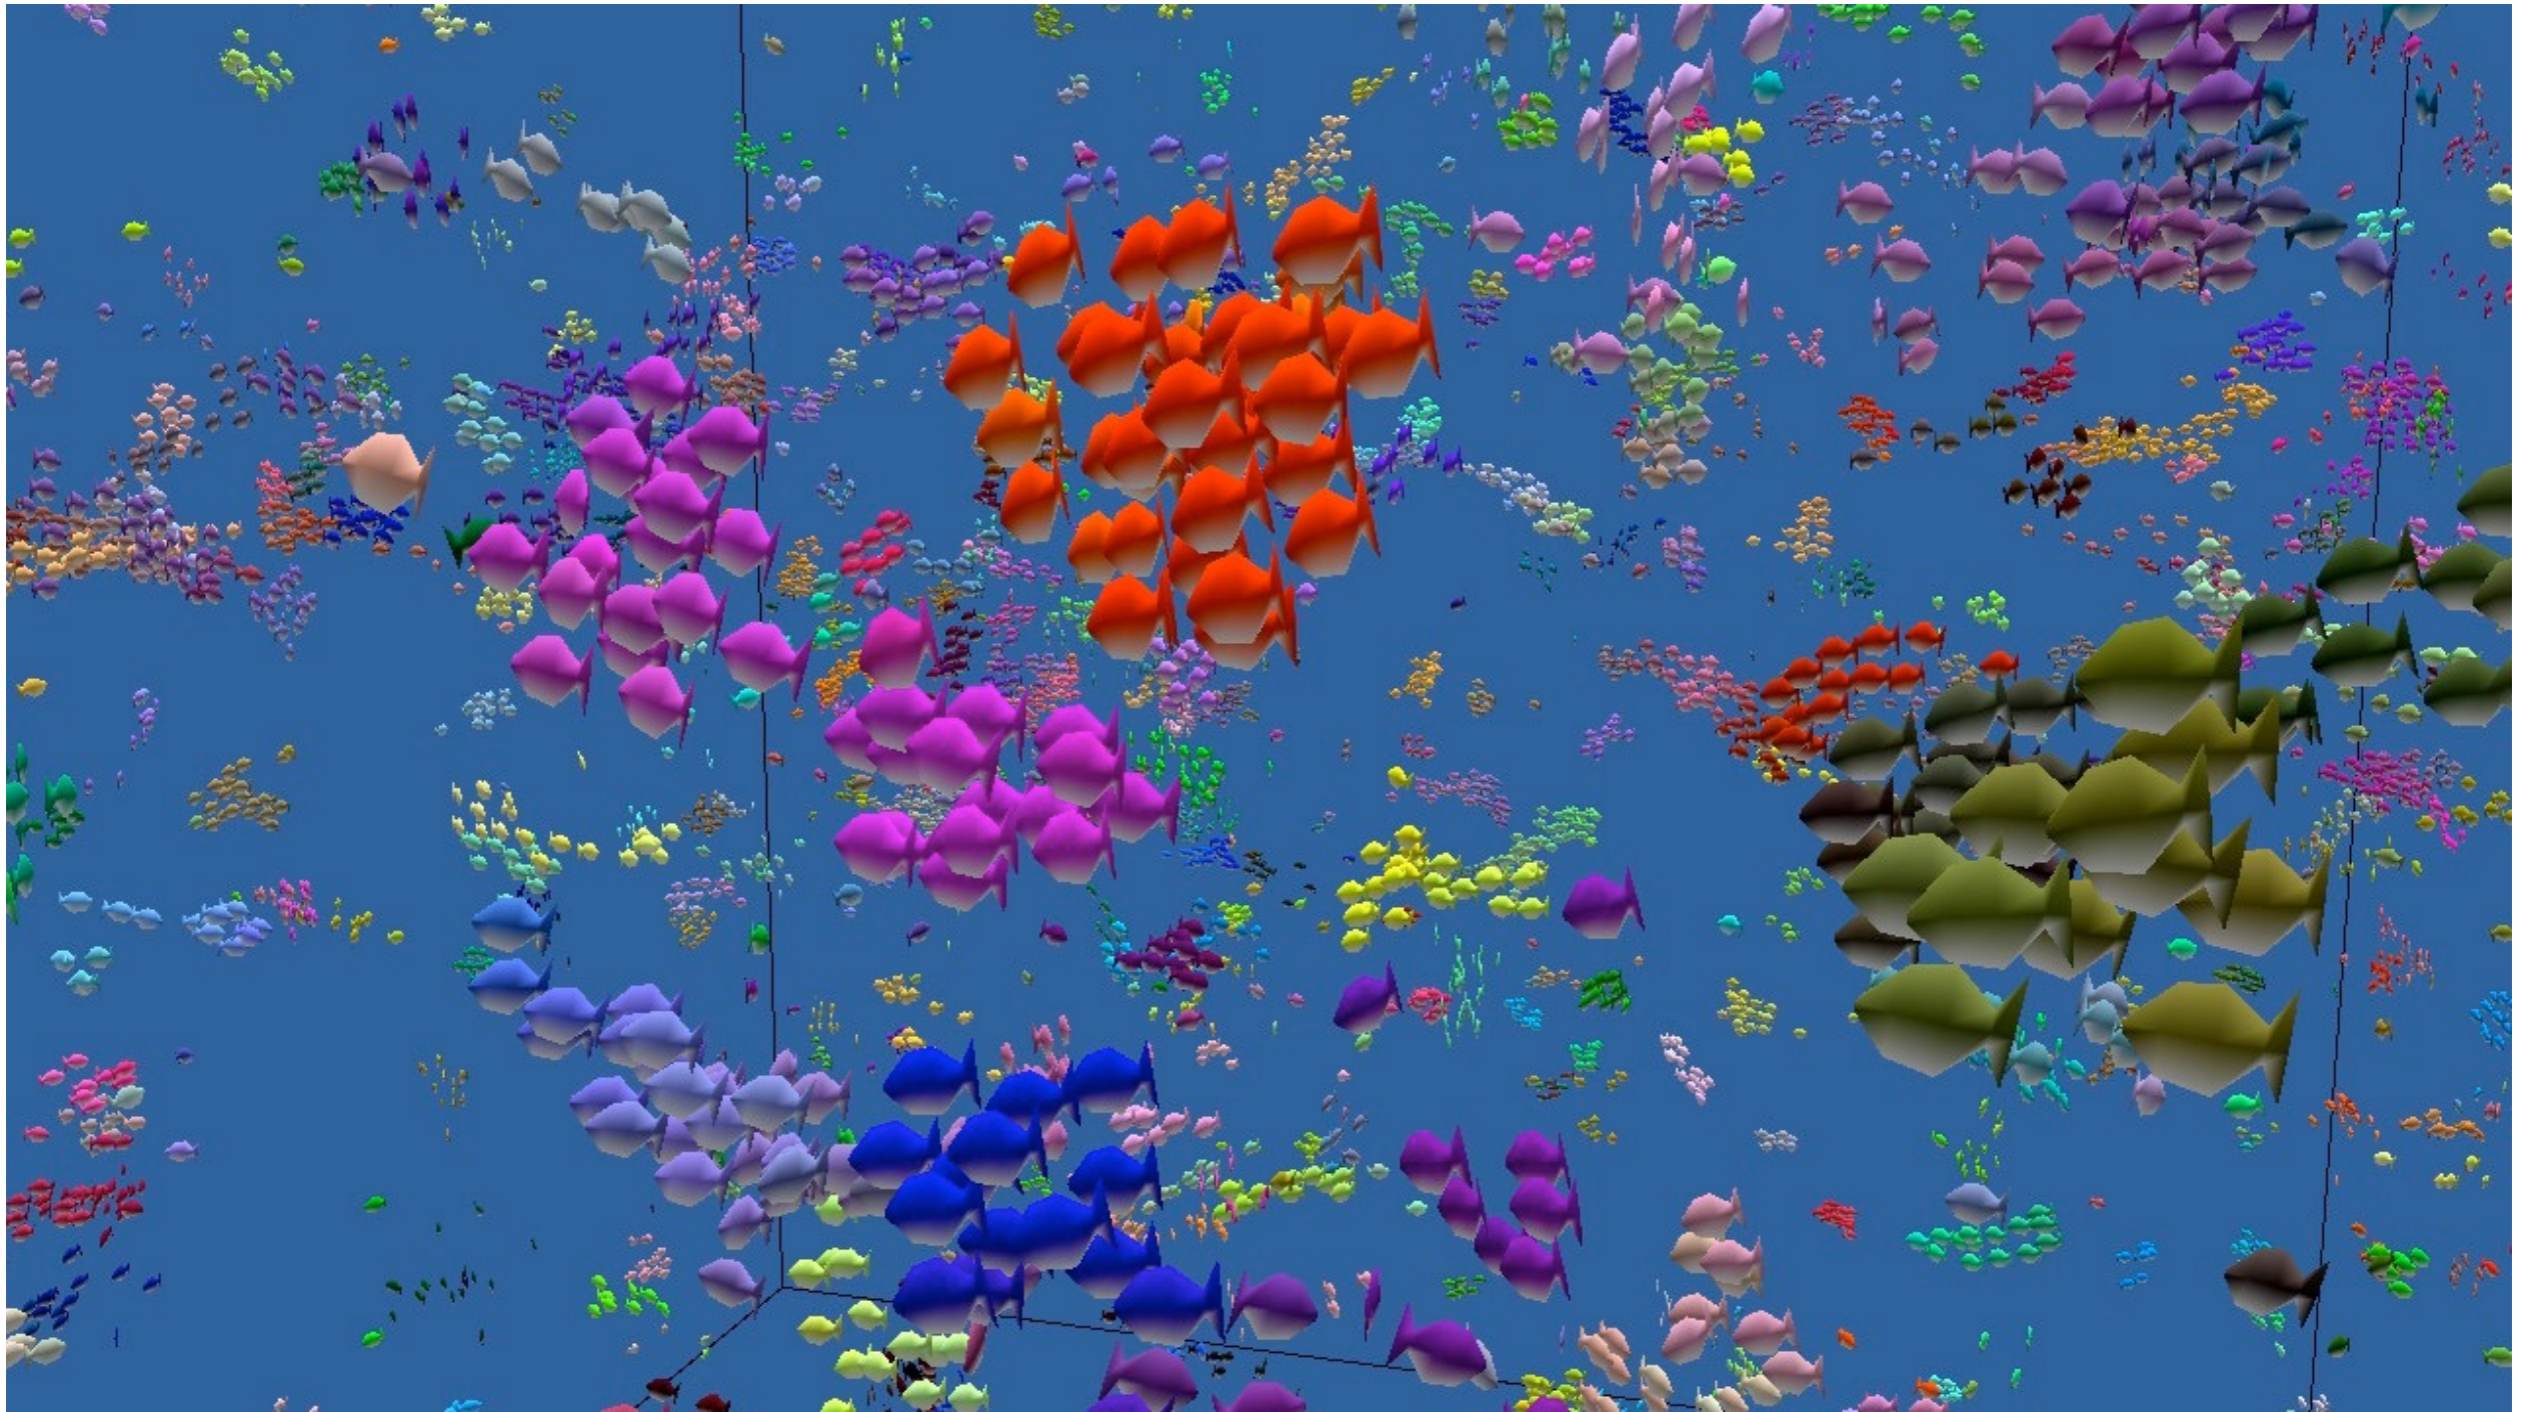

## Early boids motion test:

- flocking
- separation
- alignment
- cohesion
- seek
- obstacle avoidance

1986 screen grabs from  
Symbolics Lisp Machine

steering behaviors

---

# Steering behaviors

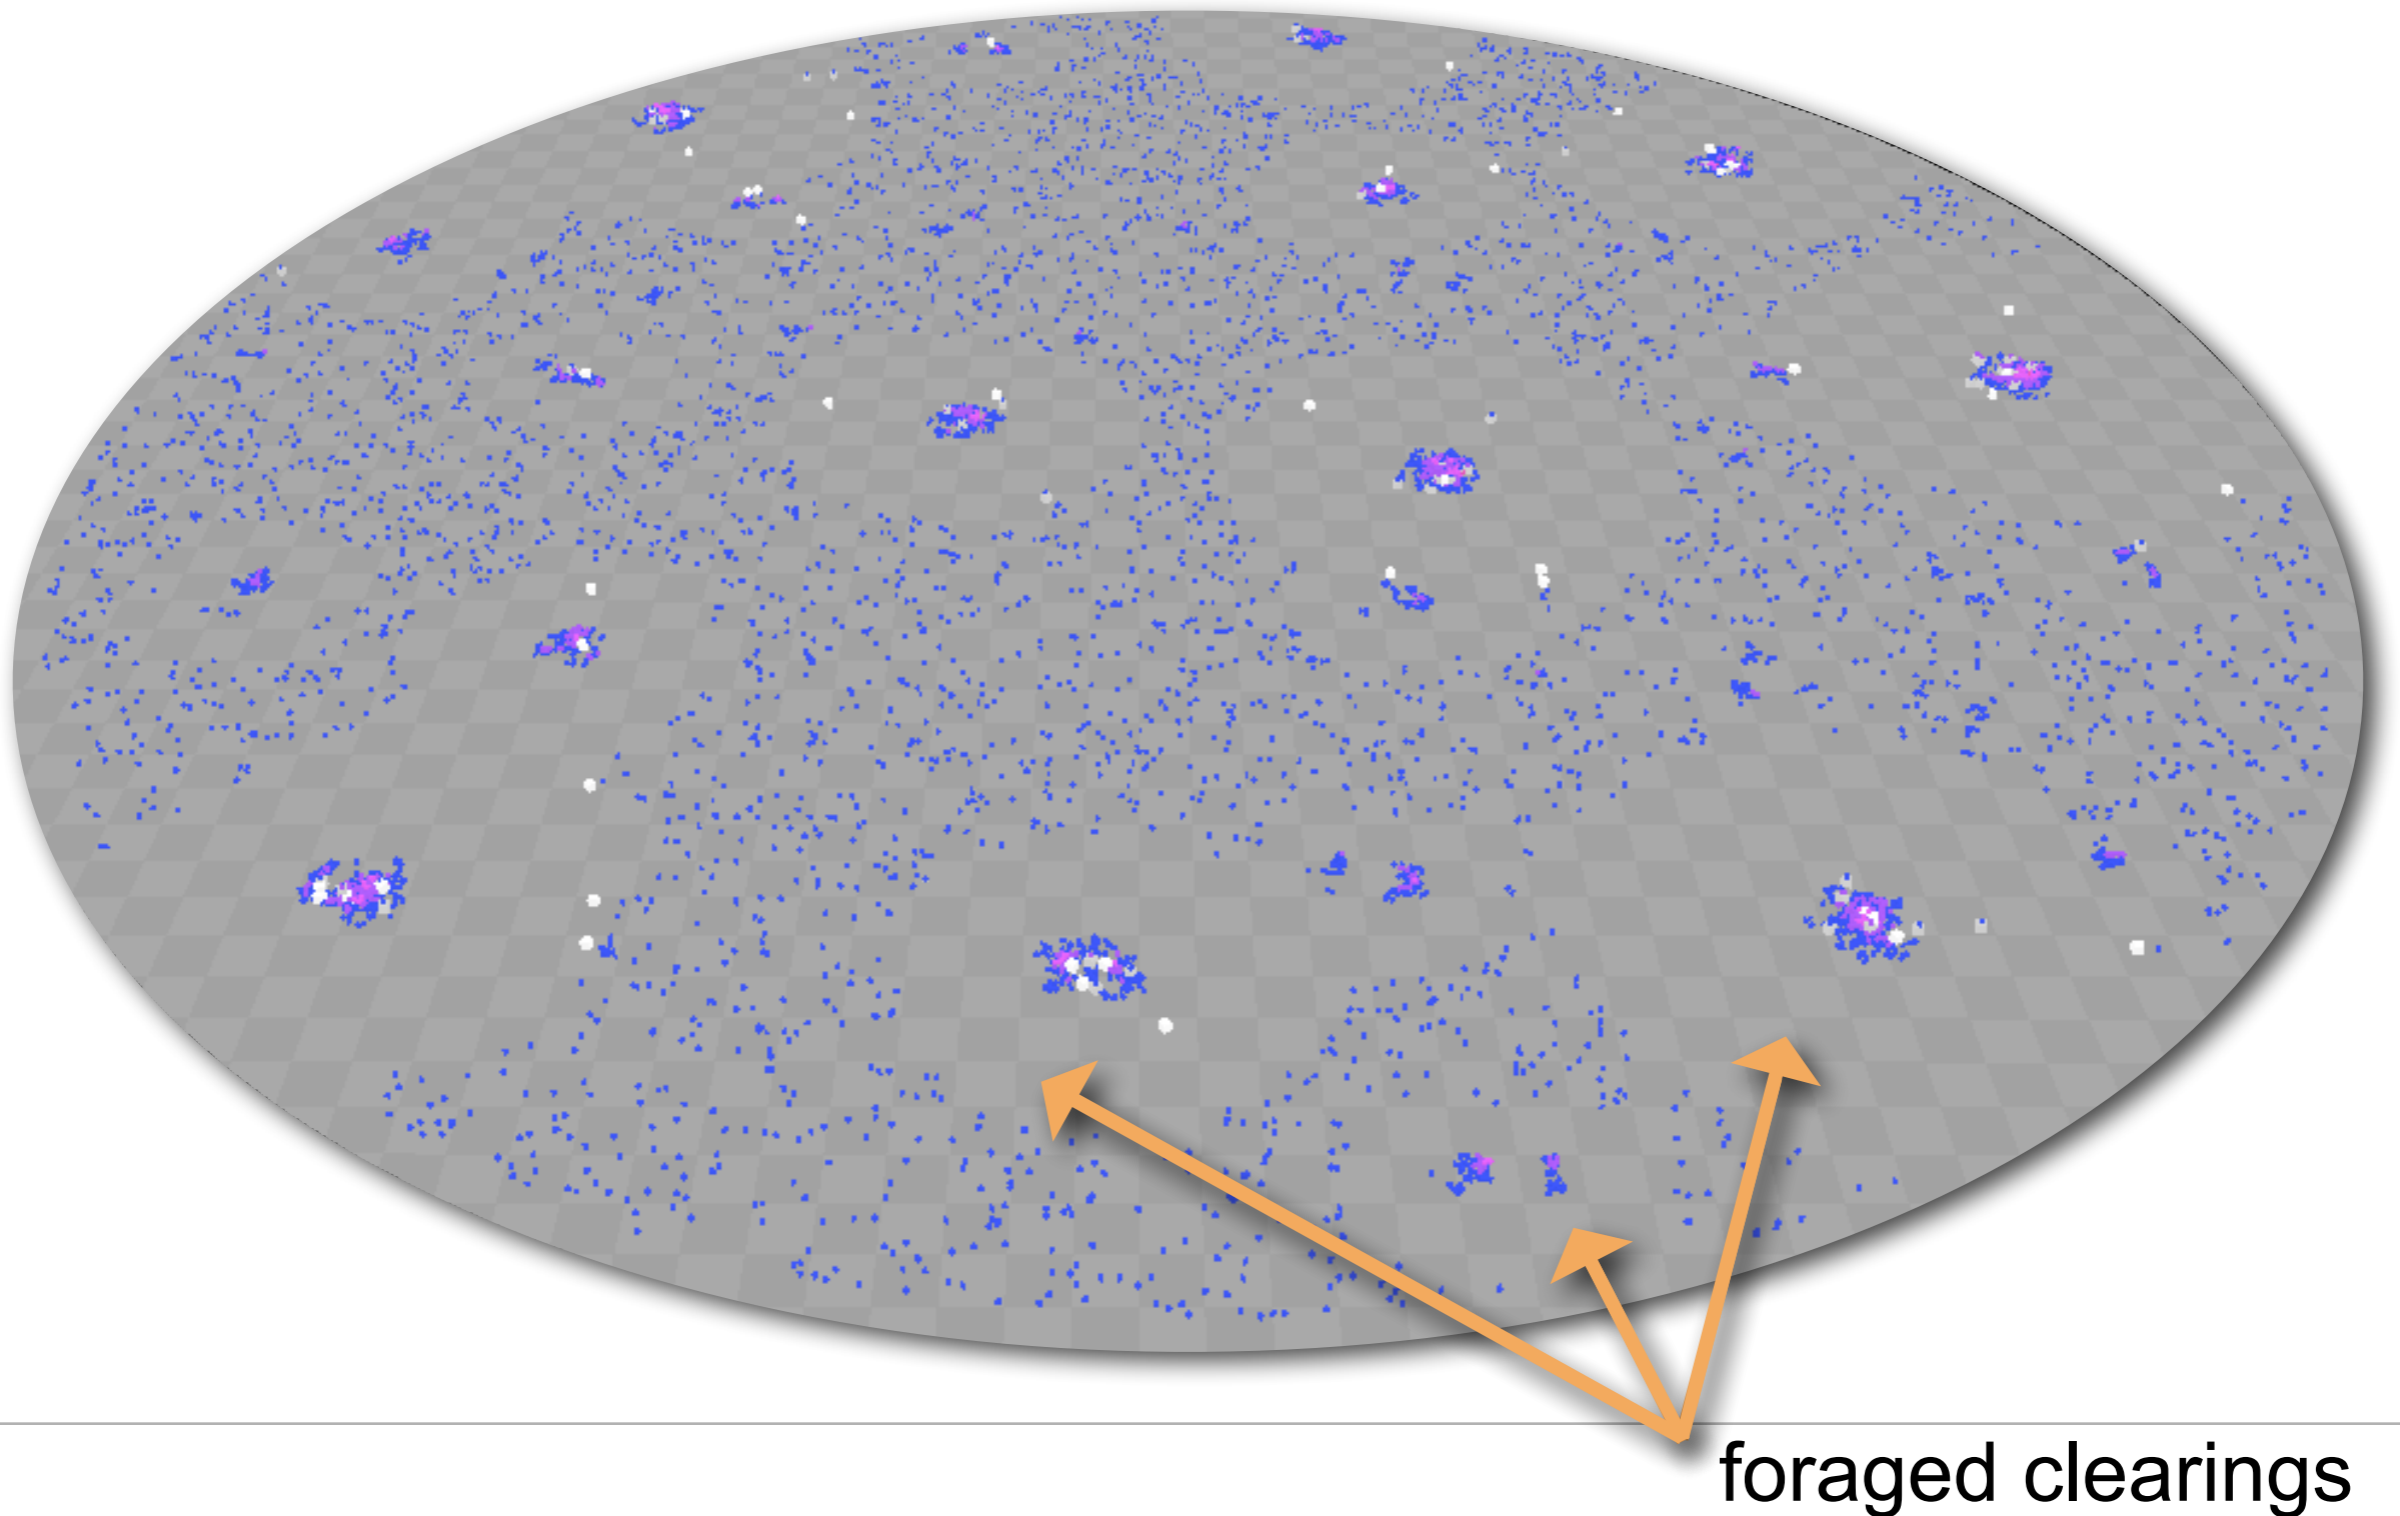

- Generalization of flocking and related ideas
  - Other kinds of navigation behaviors for agents:
    - seek, flee, pursue, evade, obstacle avoidance, path following, leader following, queuing, ...
  - Released as Java demos and OpenSteer C++ library
-

Steering behavior example, path following:

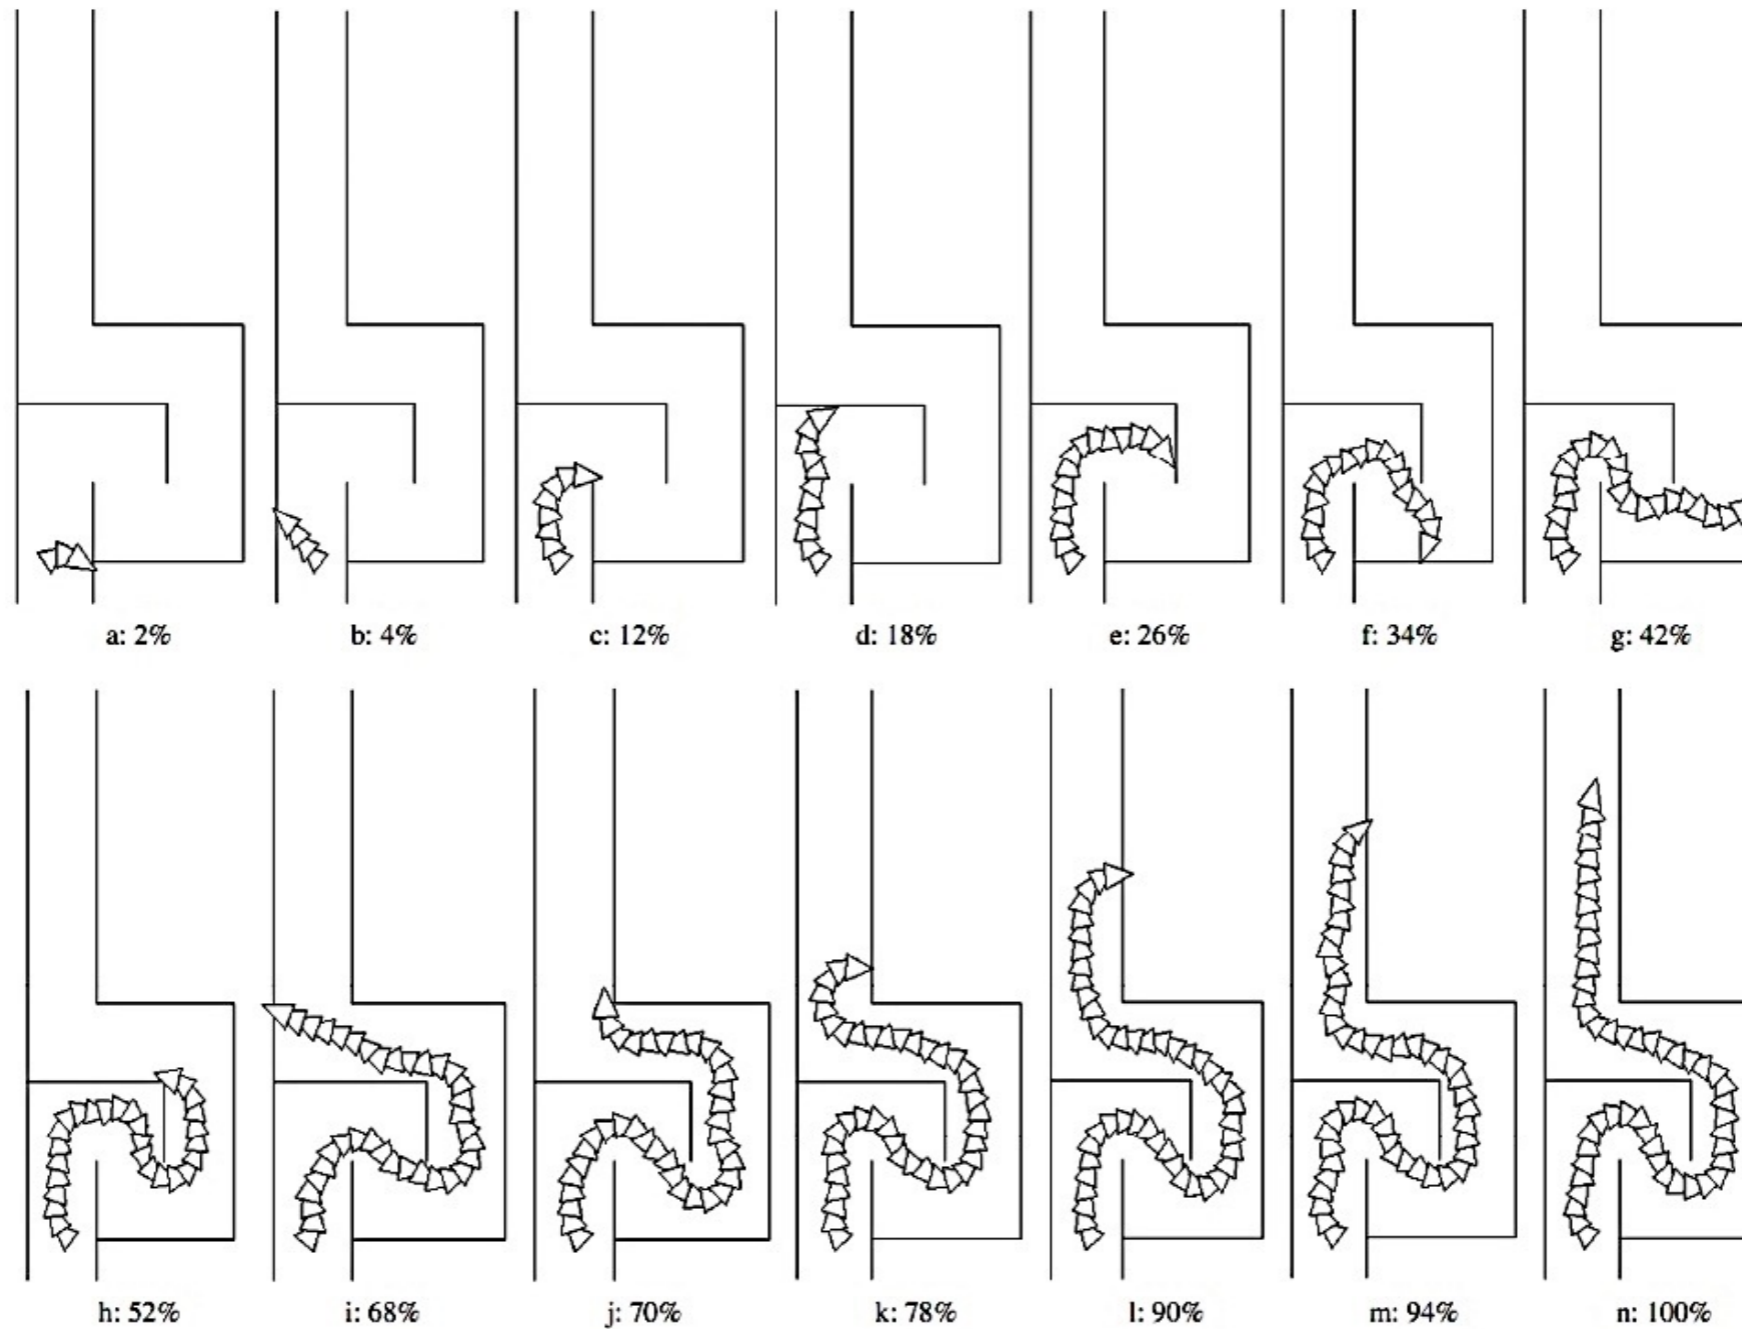

# Stigmergy: emergent team construction

# optimization for steering behaviors

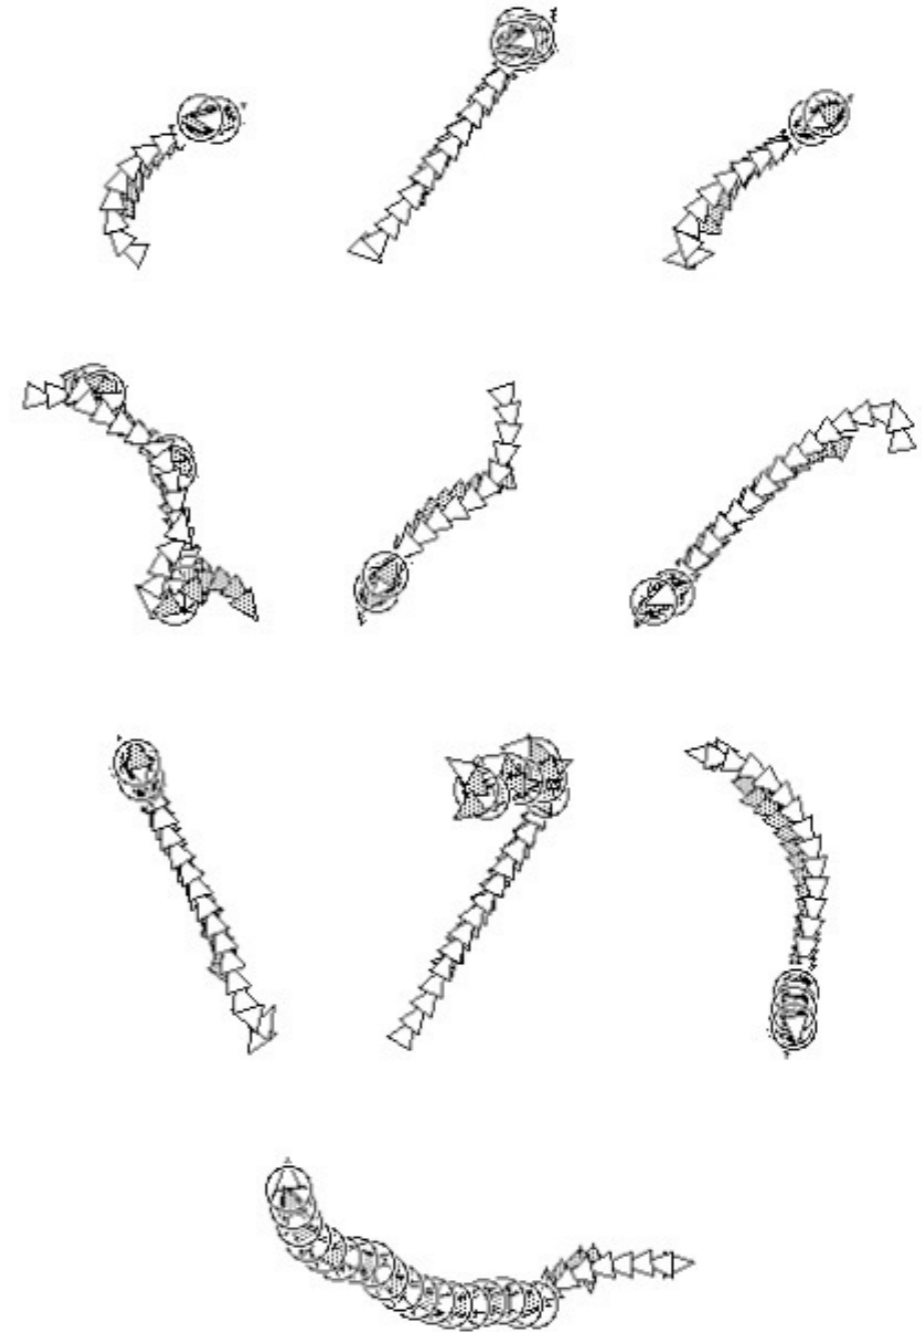

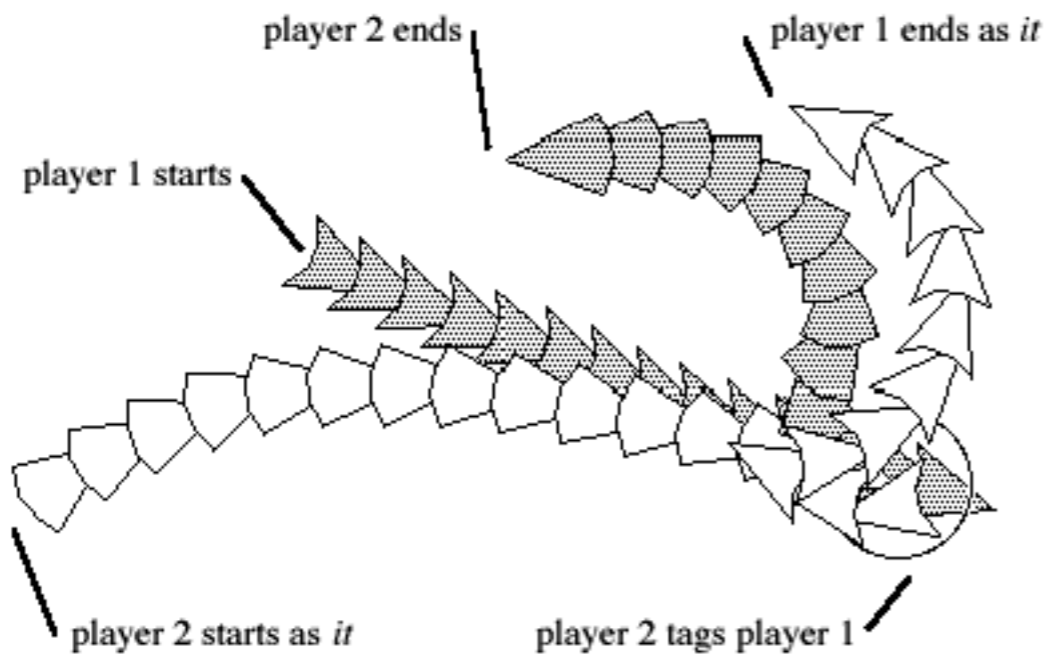

---

# Evolutionary Steering

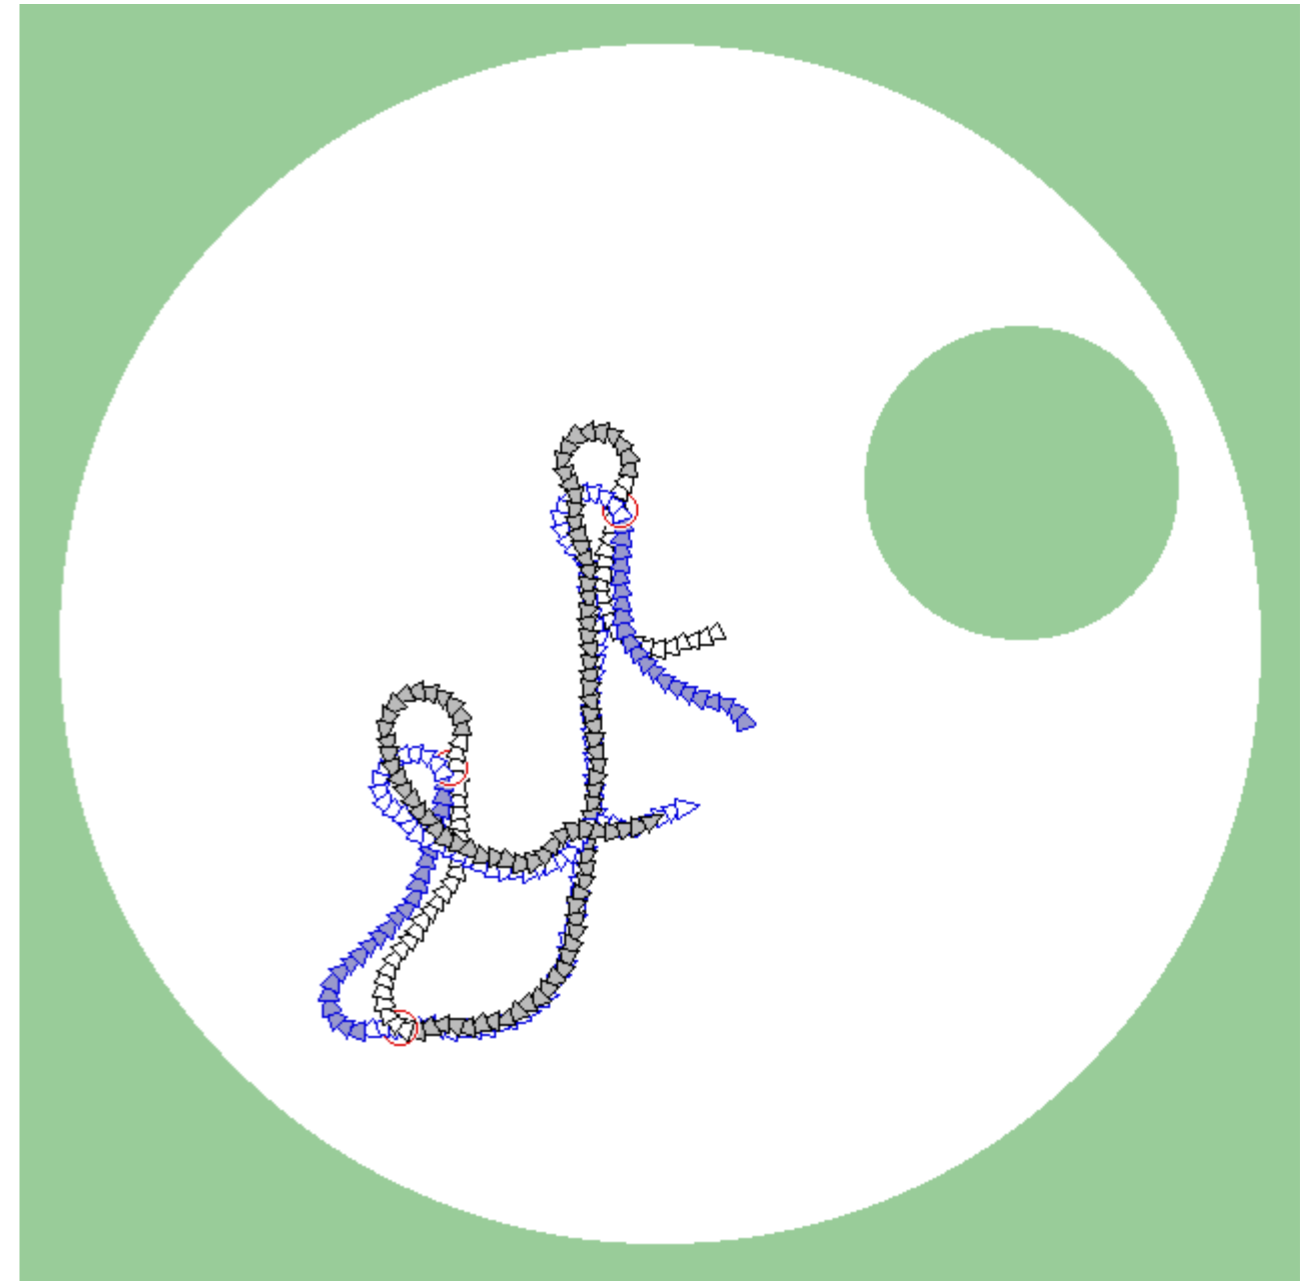

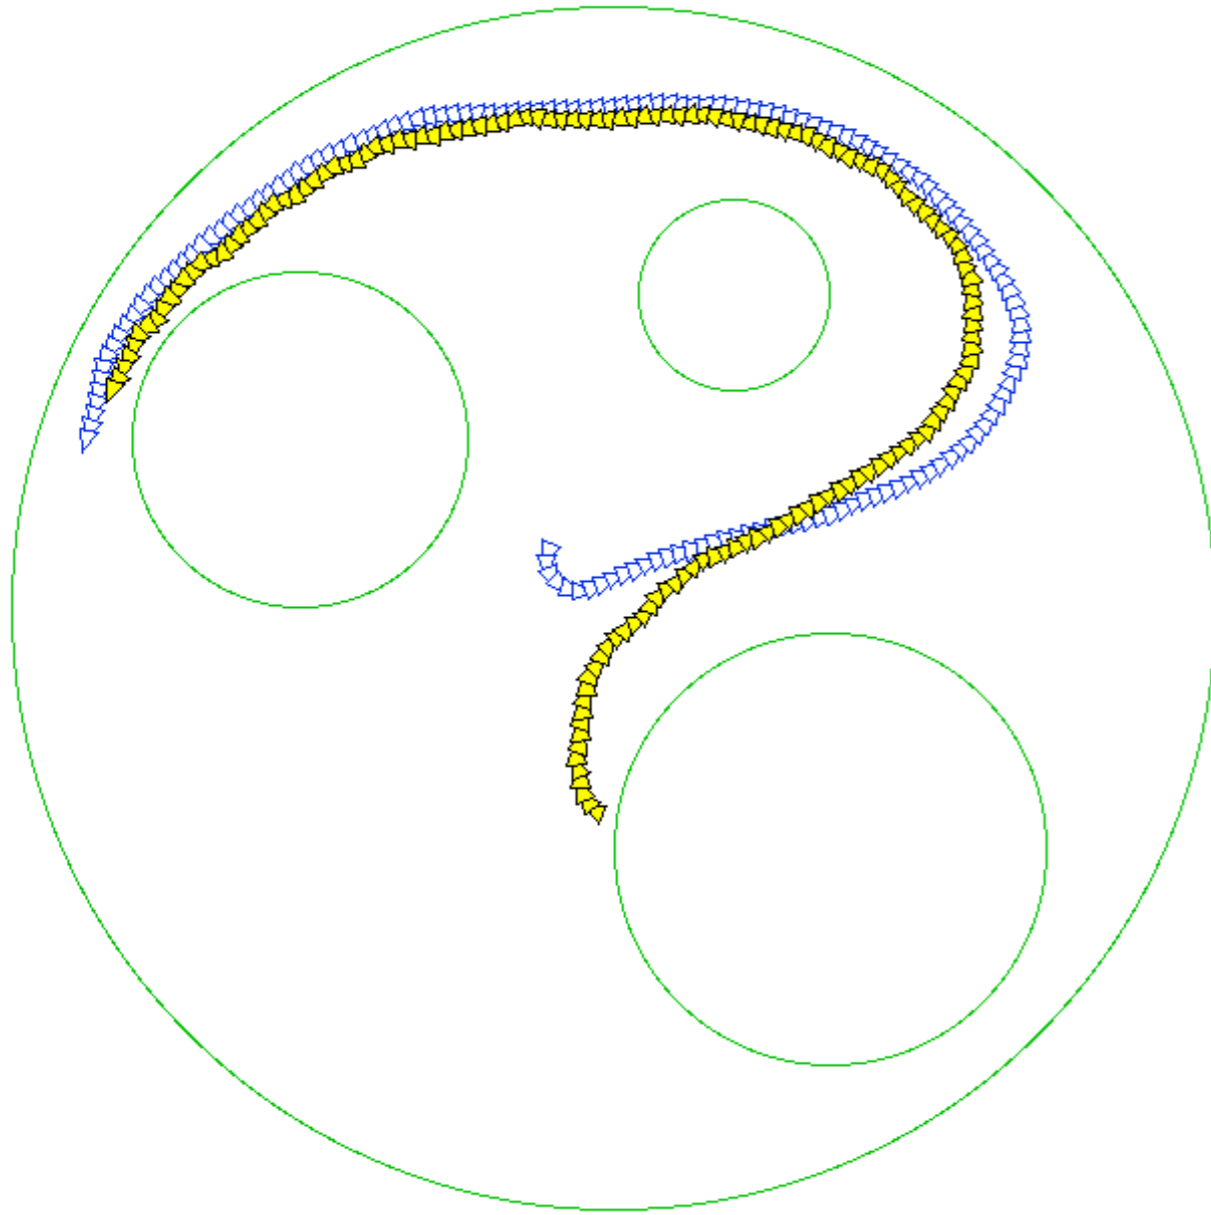

Evolution of Corridor Following Behavior in a Noisy World — SAB 1994

# Evolutionary Steering

Competition, Coevolution and the Game of Tag — ALife 1994

# Evolutionary Steering

subsequent work on “tag” with obstacles — unpublished

# optimization for texture synthesis

---

texture synthesis

+

optimization

+

goal

**goal-oriented  
texture synthesis**

**evolutionary  
texture synthesis**

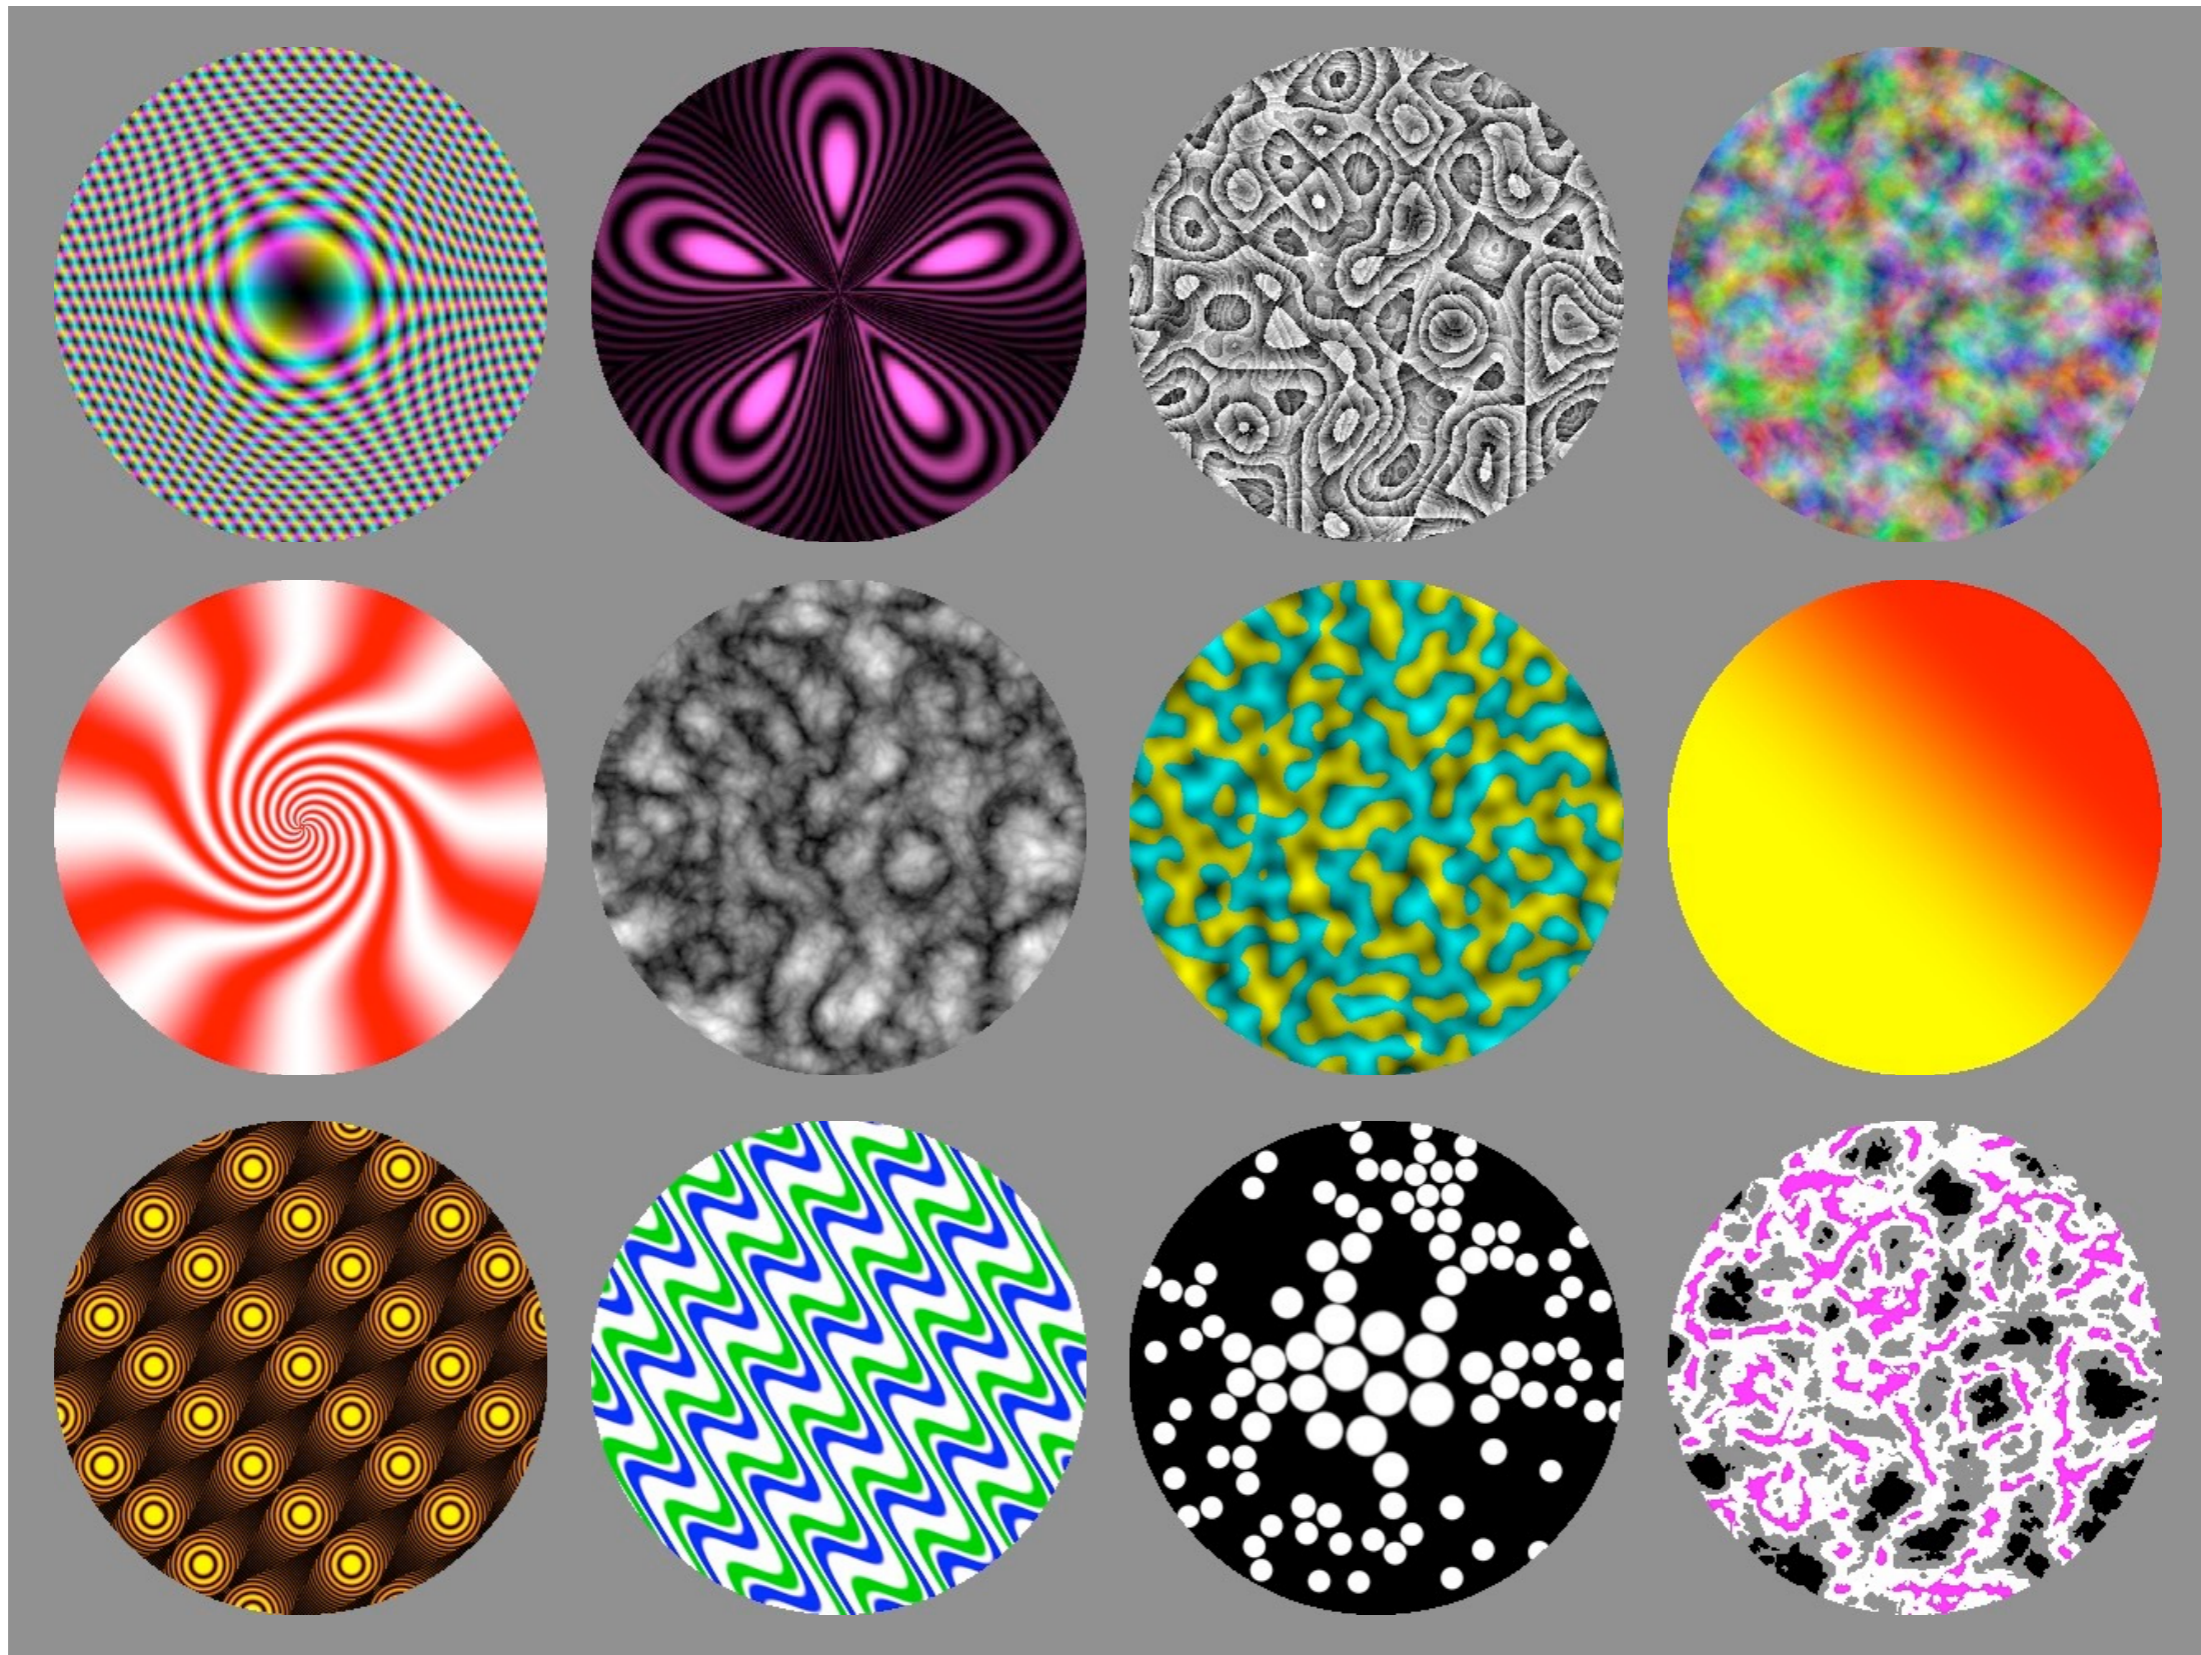

```
graph TD; A[evolutionary texture synthesis] <--> B[automatic fitness from computed image metrics]; A <--> C[interactive fitness from human visual judgment];
```

**automatic  
fitness from computed  
image metrics**

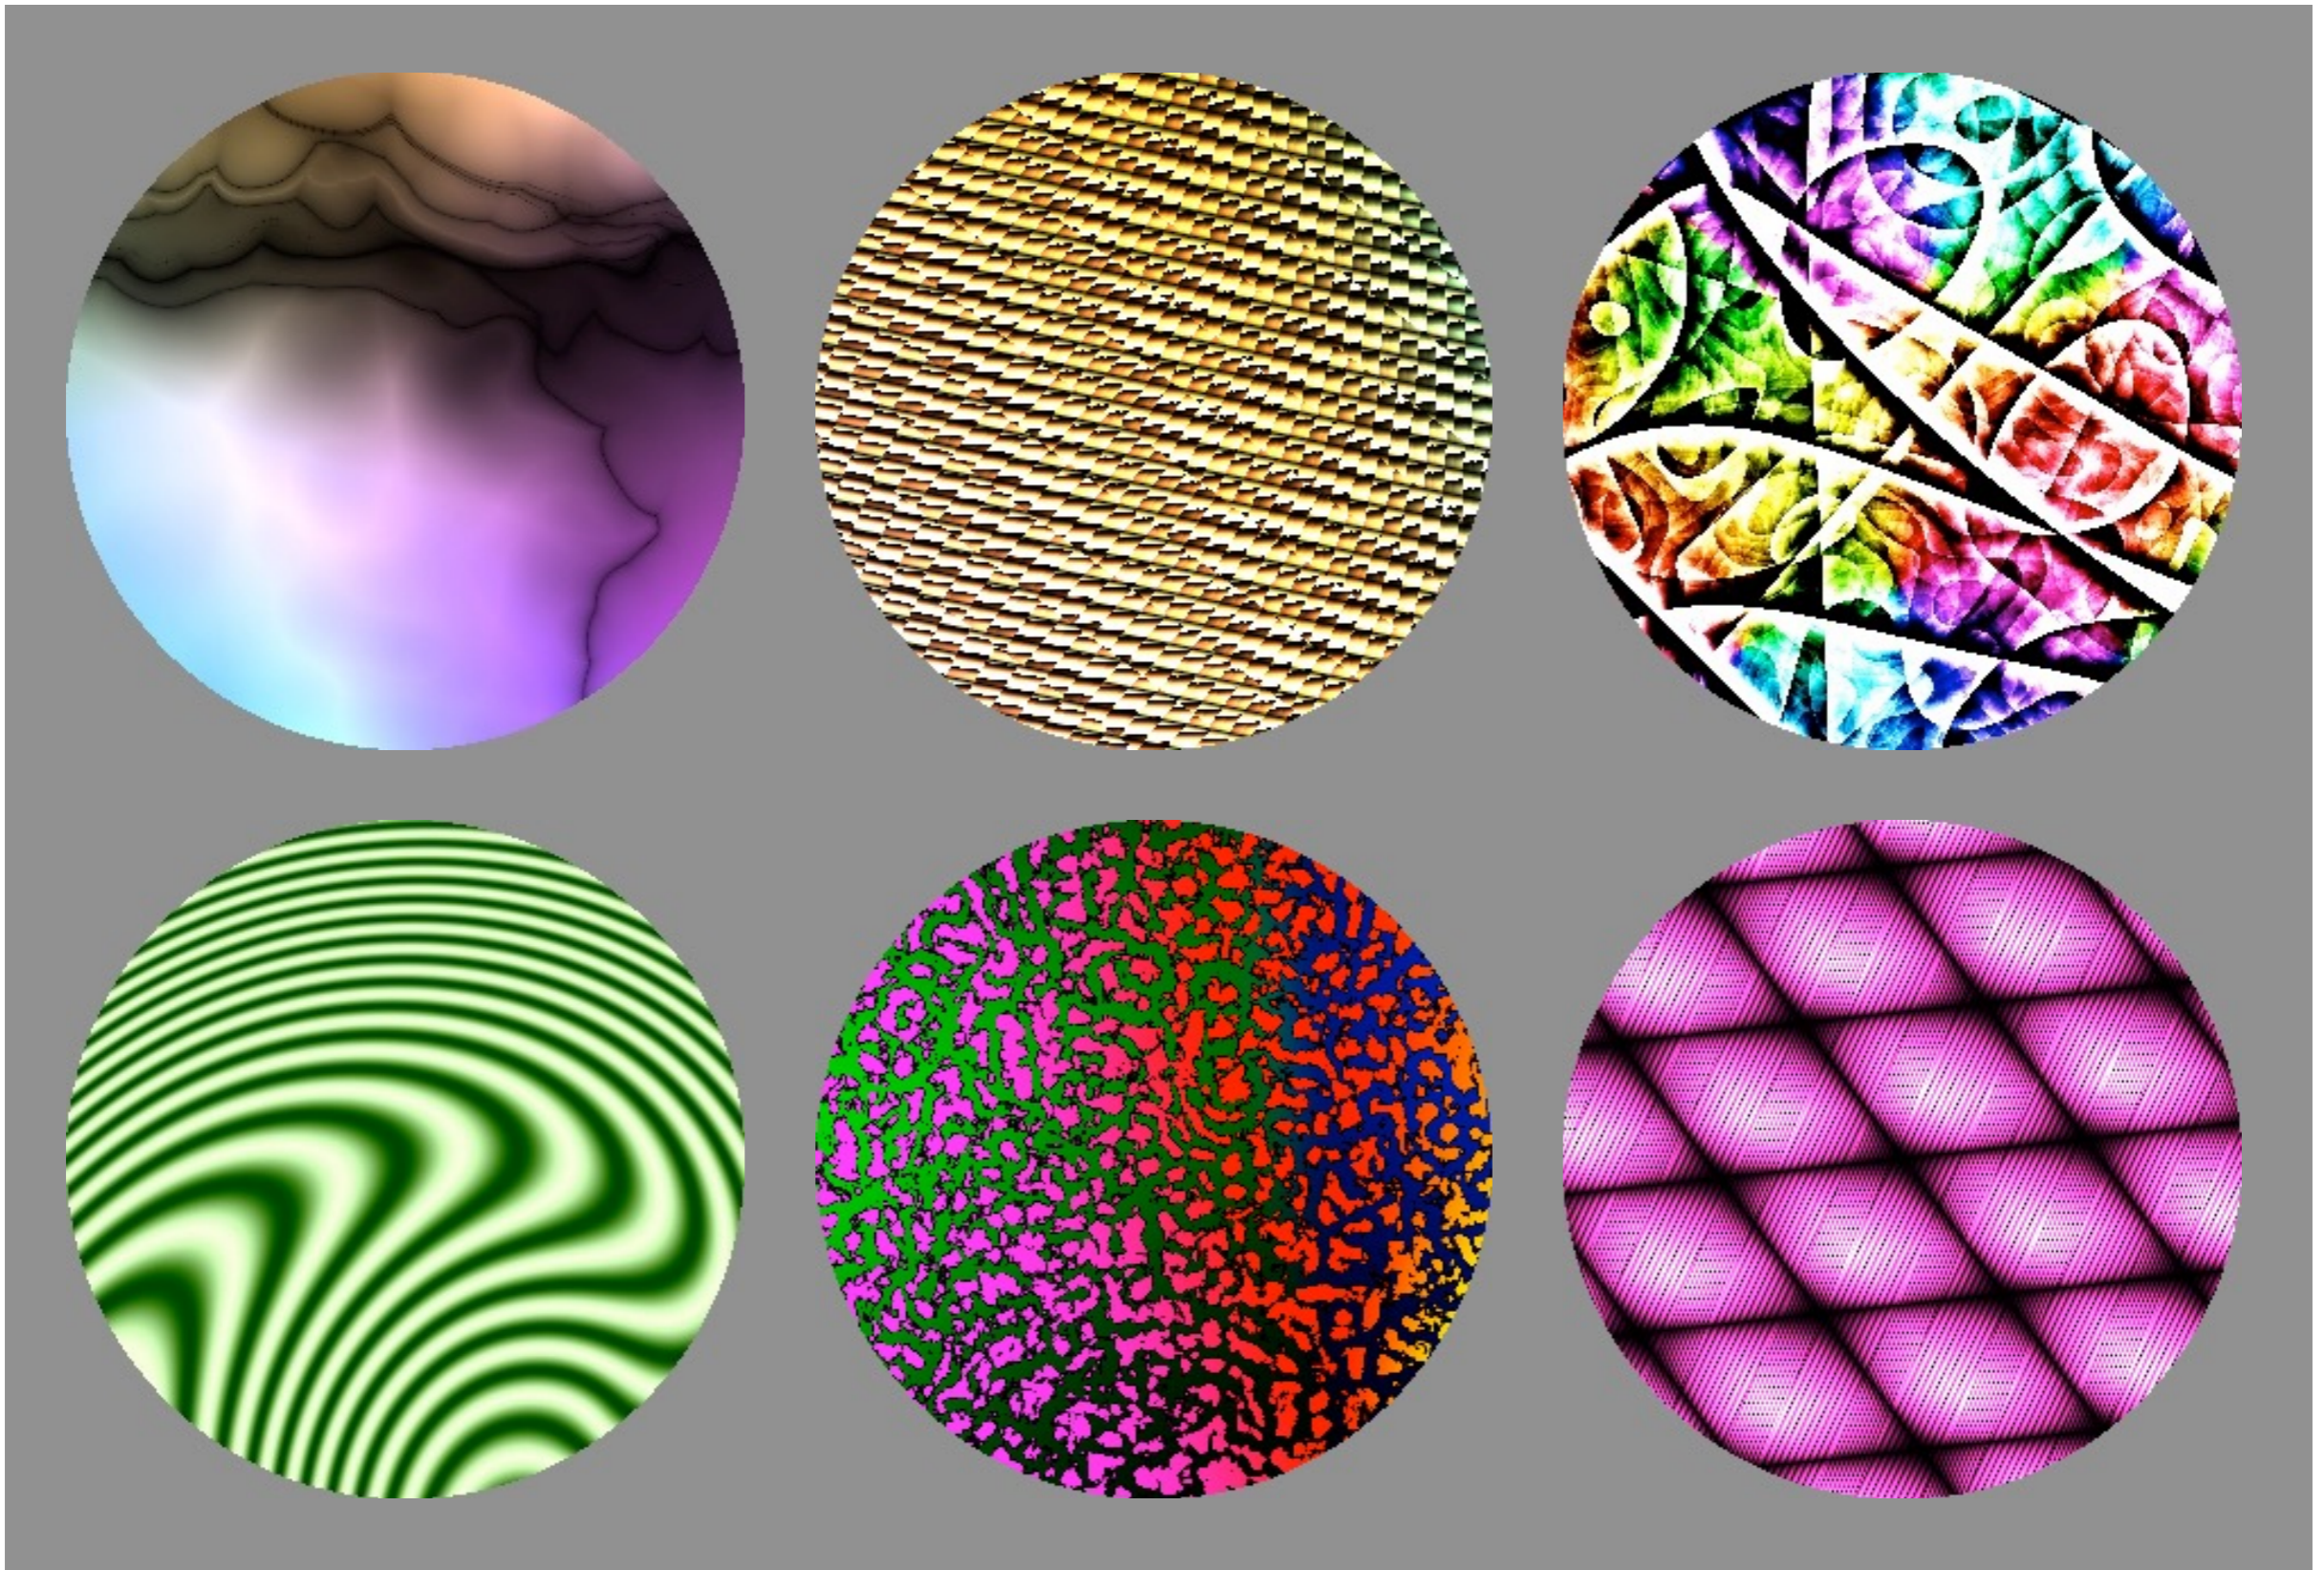

**interactive  
fitness from  
human visual judgment**

# procedural fitness for texture synthesis

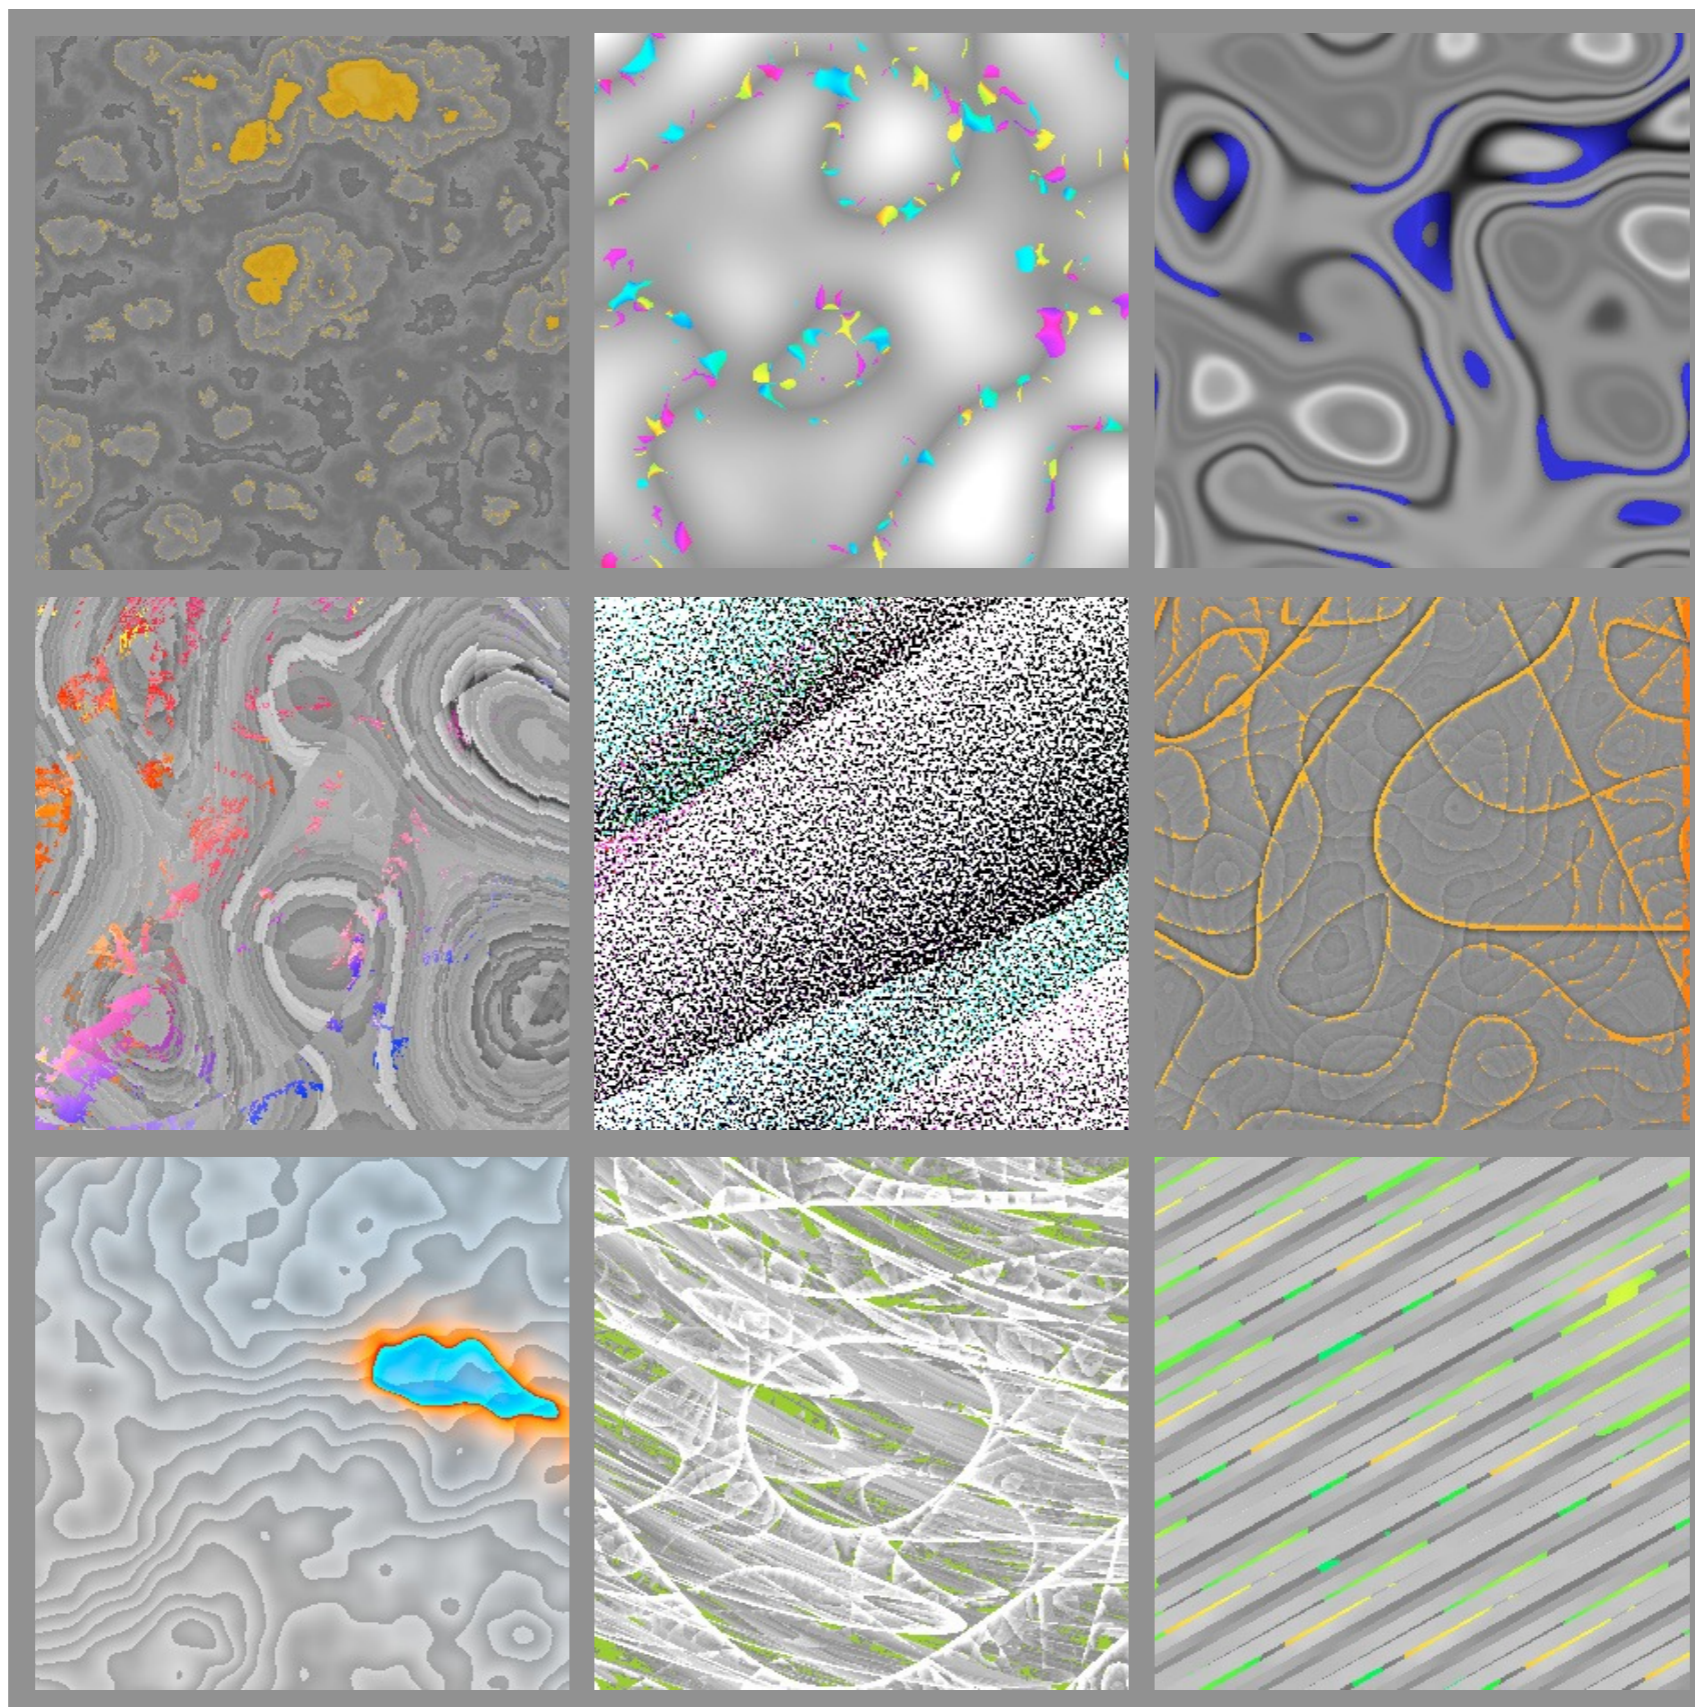

---

simple hand-written combinations of texture synthesis primitives

textures evolved with GP — procedural fitness

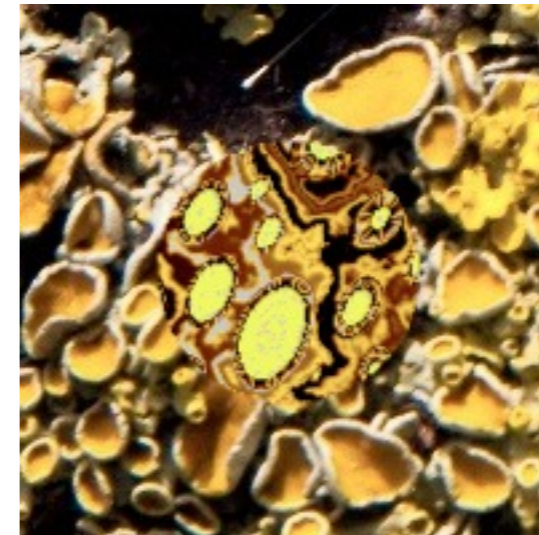

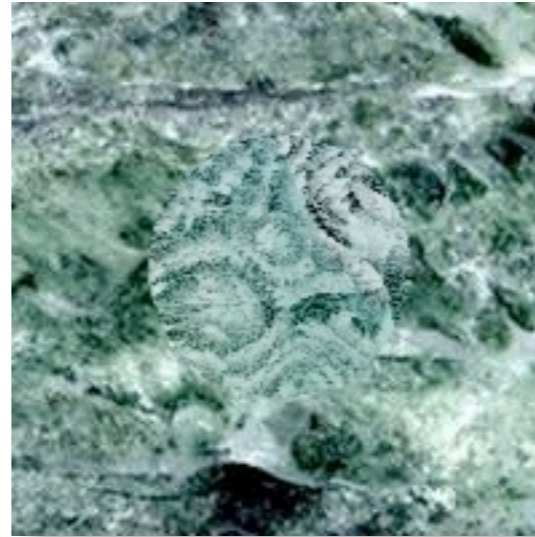

Evolved textures: gray with accent color

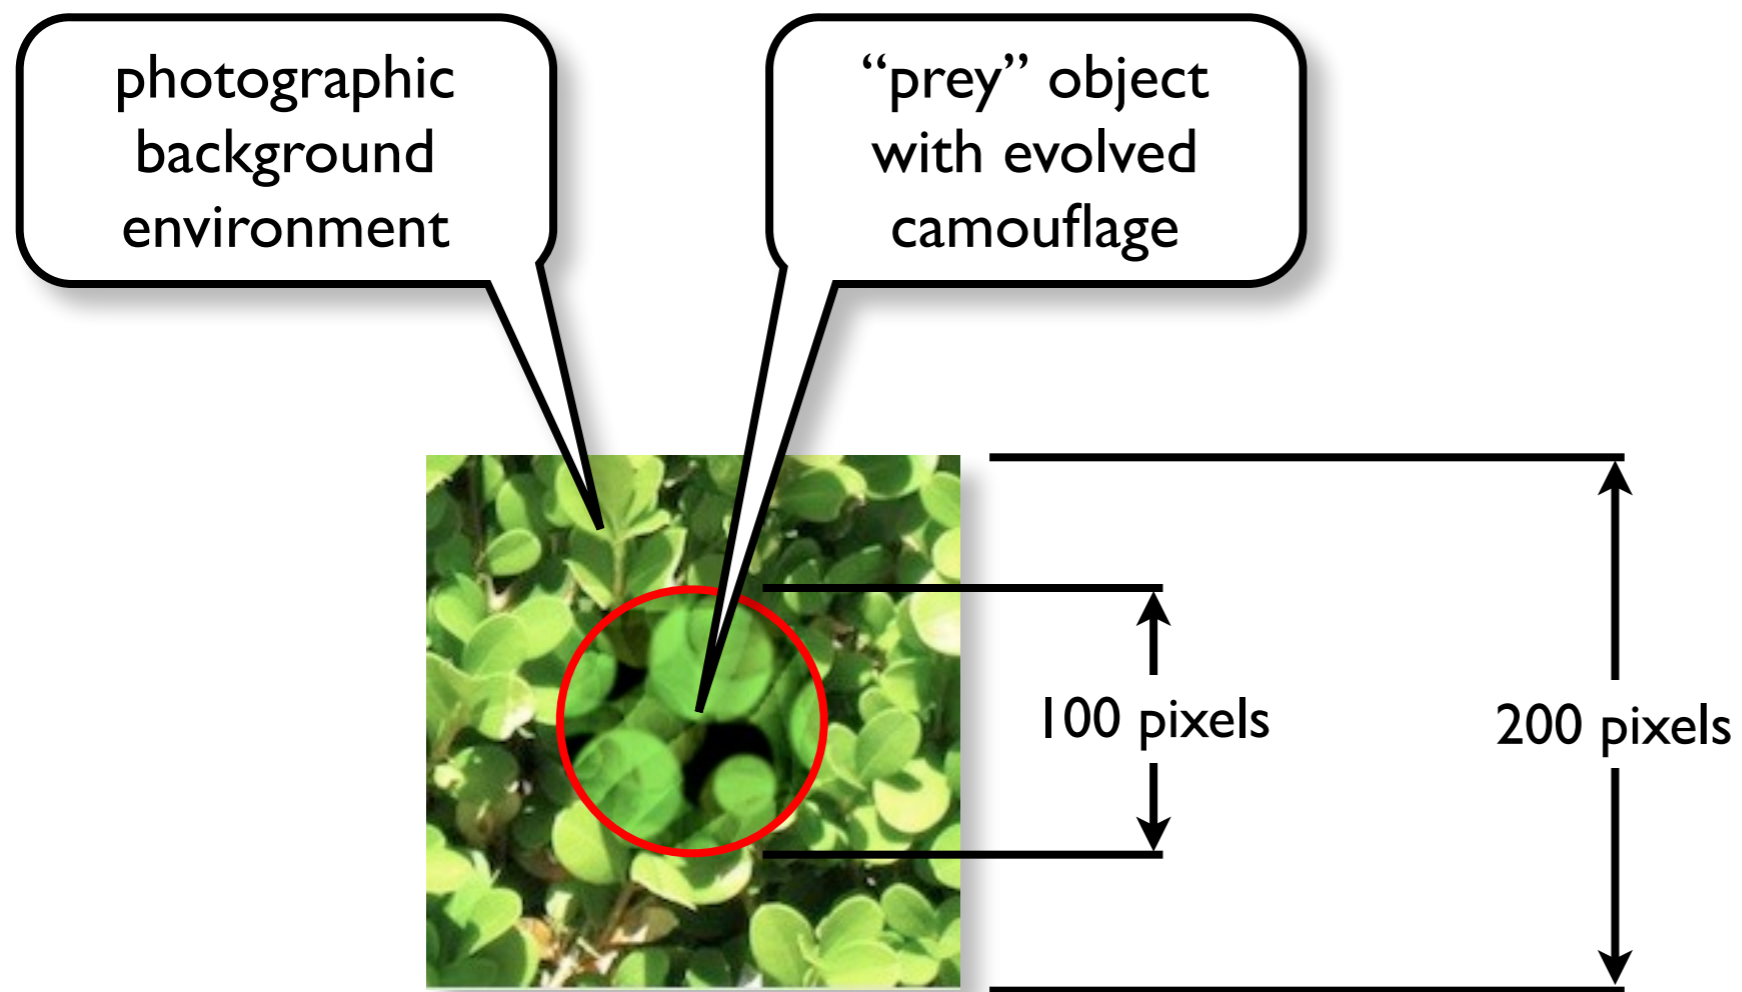

# interactive fitness for texture synthesis

---

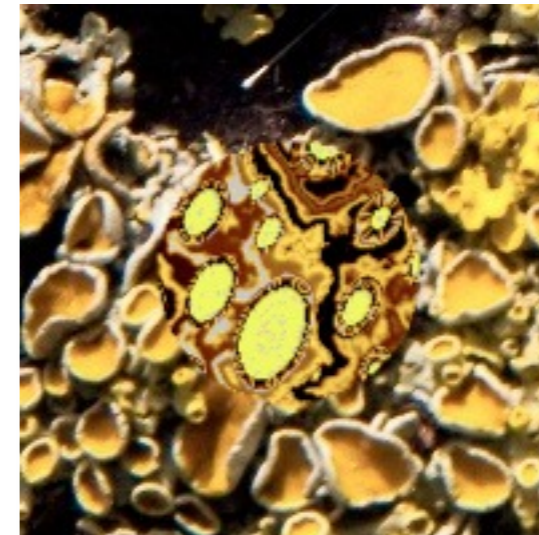

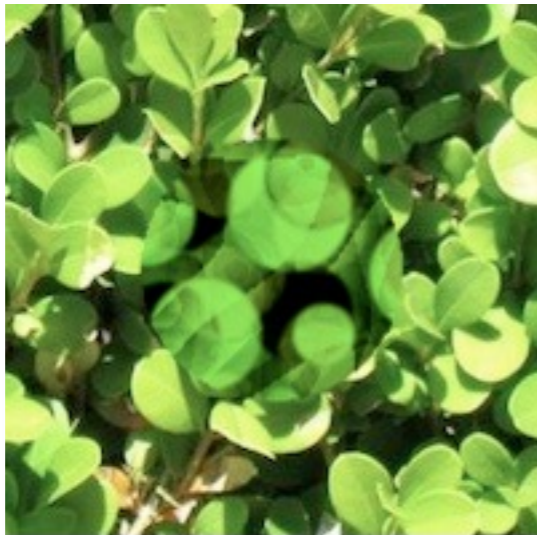

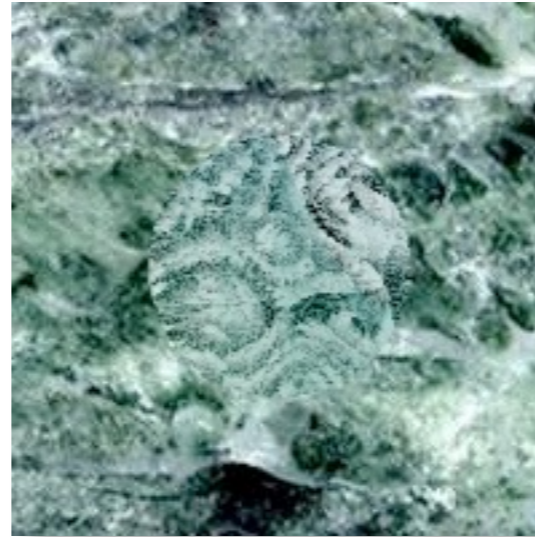

# Evolved camouflage

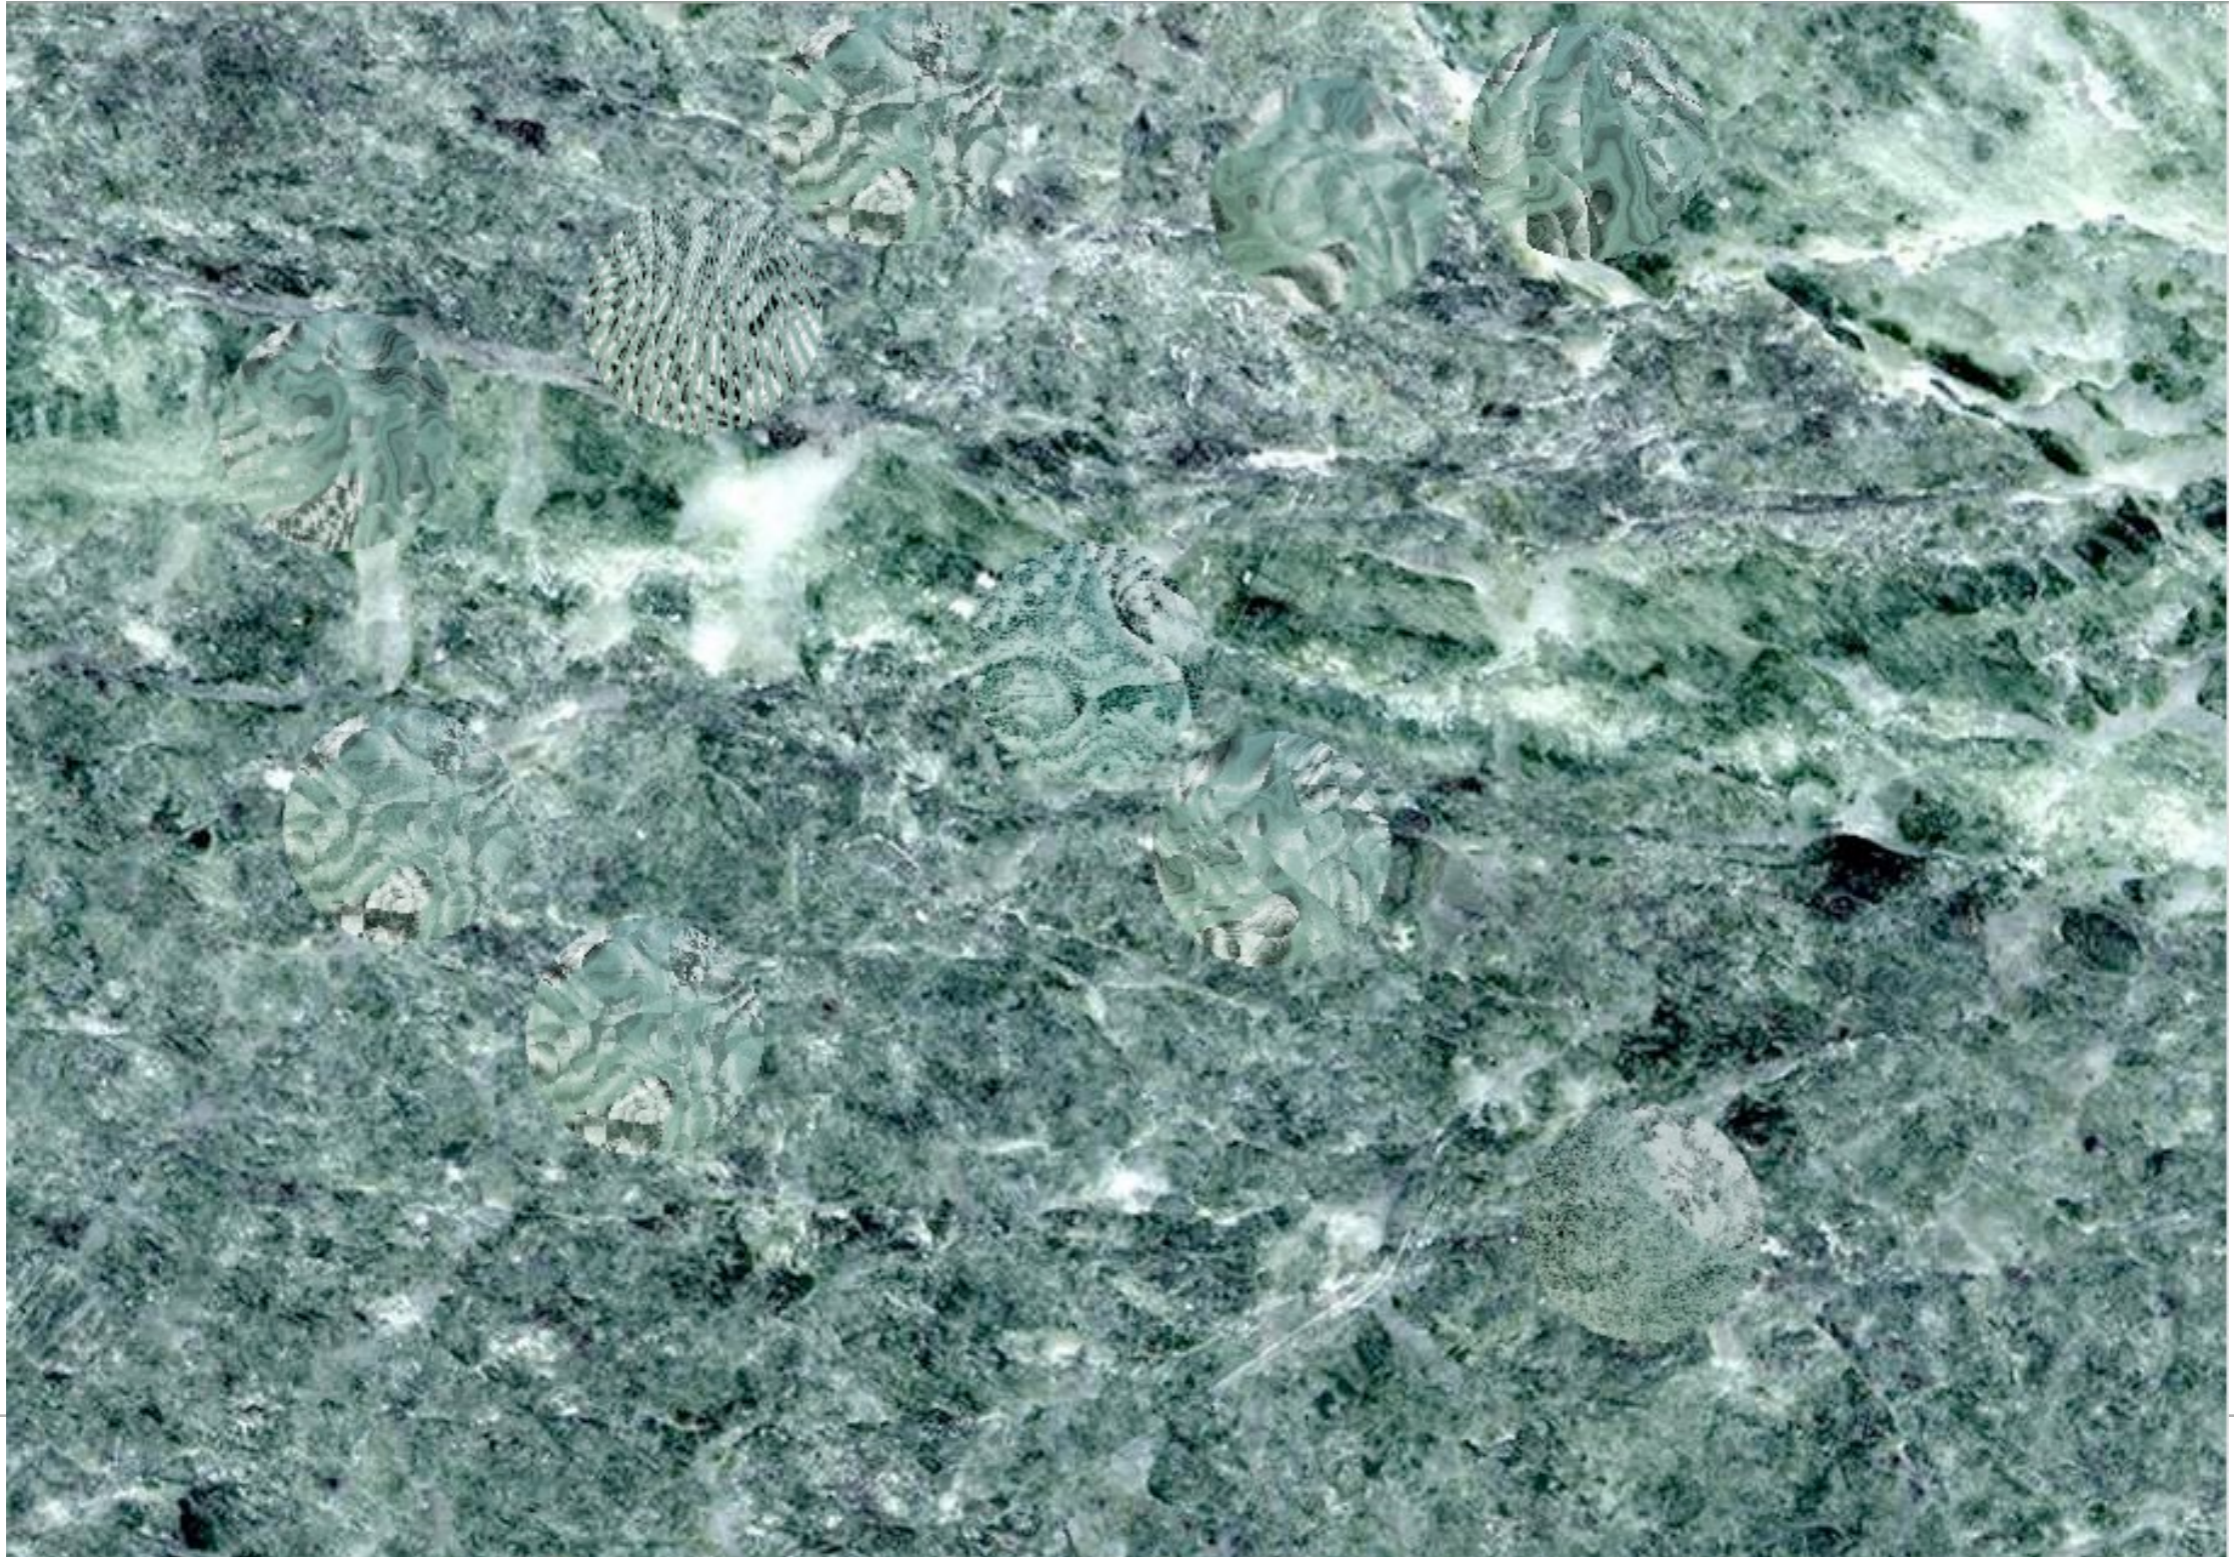

# Structure of *thumbnail* images

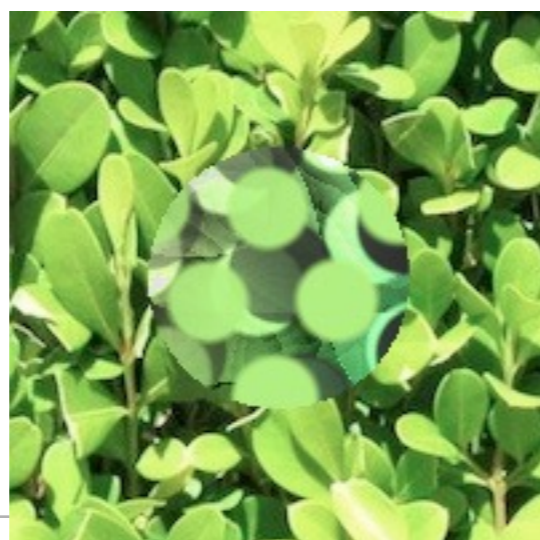

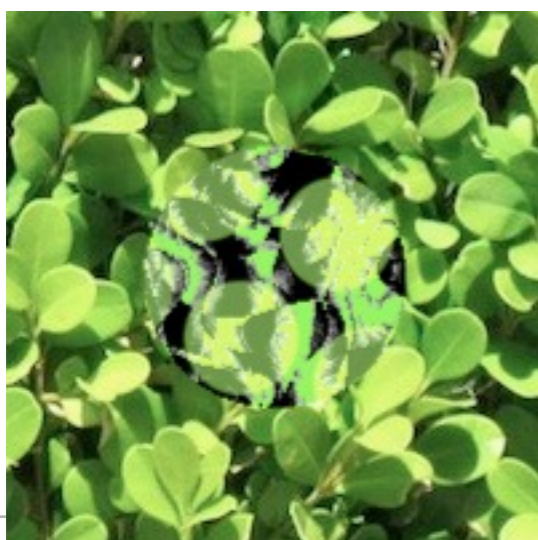

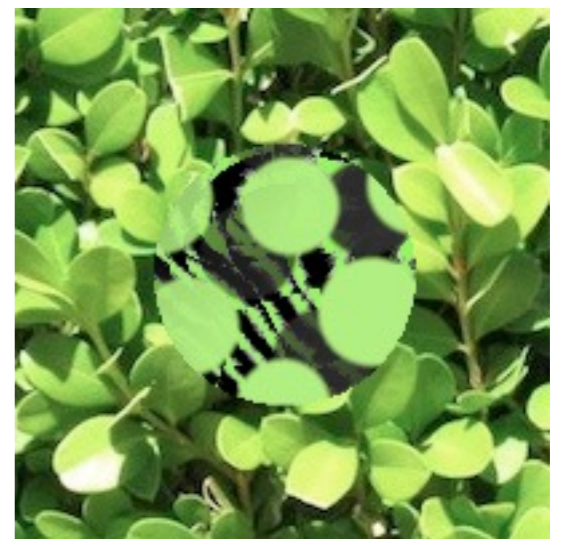

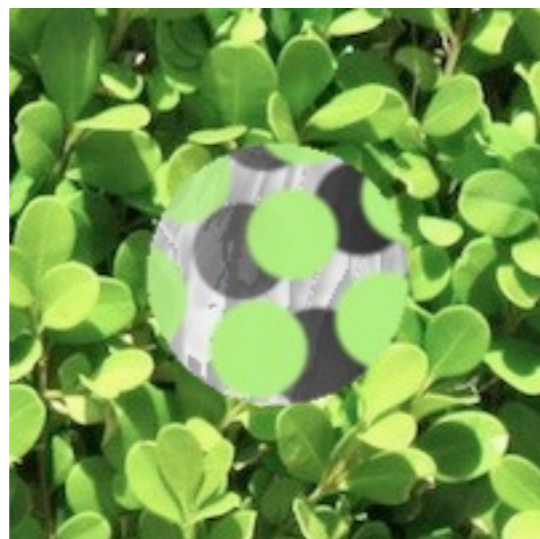

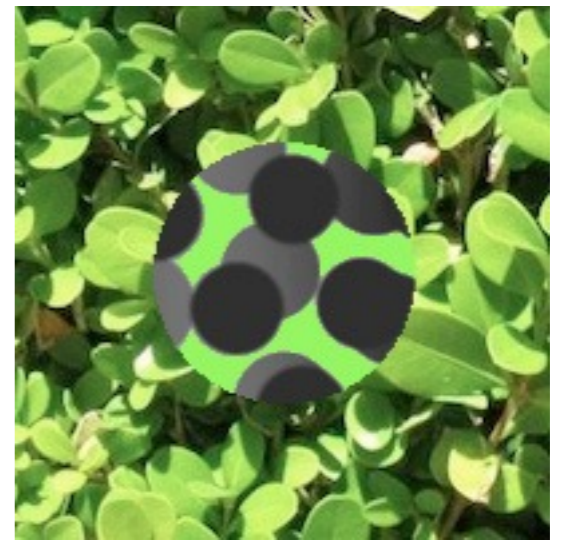

# Evolved camouflage

# Cohort on environment

(shadows?!)

# Thank you!
